# MATHEMATICS IS THE INDISPENSABLE FOUNDATION KNOWLEDGE FOR TODAY'S JOBS and the new technical

Post-War Jobs

THOUSANDS of new jobs are waiting for trained men!
Every industry is working at top capacity to meet the
needs of our gigantic wartime program. Trained mechanics
and technicians are in urgent demand. After the war, peacetime needs will be as great!

And in the best of these jobs, the jobs which offer the highest pay and the greatest assurance of steady employment, a knowledge of mathematics is required, because mathematics is the foundation of all technical work. Give yourself this basic preparation now by this quick, inexpensive home-study method—a complete mathematics course in five volumes.

# MATHEMATICS for Self Study

by J. E. Thompson, B.S. in E.E., A.M., Dept. of Mathematics, Pratt Institute

(Centinued from facing cover)

solve problems which are involved in all military and industrial work, relating to machines, engines, projectiles, ships, planes, etc. Logarithms and slide rule, and many other practical applications.

GEOMETRY: Brates clearly all needed facts about plane figures, circles, polygons, etc. Covers all the topics essential in drafting and engineering. It deals at length with angles, triangles, circles, and the many other geometric figures that are basic to engineering design. Sheet metal work, so important in airplane construction, is a direct application of these principles. So also is the laying out of bhip buils, which is the major activity in ship construction. The properties of circles and apheres explained in this volume also apply directly in navigation.

TRIGONOMETRY: This volume makes easy the principles of angles and triangles, shows you how to use tables that explain their functions. Practically every problem in machine work, land surveying, mechanics, astronomy, navigation and range finding is solved by methods of trigonometry. These methods are explained here in the most simple way with actual examples of calculations of height and distance as they are applied directly to the sighting of guns and the determination of the position of a ship at sea, the construction of buildings and fortifications, the cutting of gears, etc., etc. All necessary tables for making these computations are furnished in this book as they are in all the other volumes of this series.

### **Examine These Books FREE**

Send no money now. The coupon brings you the 5 backs for 10 days' trial. After 10 days return the books to us without obligation or send us the small down payment of \$2.95, balance in three monthly payments. Mail the coupon today. D. VAN NOSTRAND COMPANY, Publishers, 250 Fourth Avenue, New York J. N. Y.

CALCULUS: You will enjoy mastering calculus in this interesting new way and will find it will enable you to solve problems that can be solved in no other way. This branch of mathematics deals with rate problems. It is essential in computation involving objects moving with varying rates of speed. It also enables us to find the most efficient design for any kind of mechanism, engine, or moving vehicle. Typical problems included in this book are the calculation of the velocity with which a man supported by a parachute strikes the ground, the path of a bullet or shell, the work done by expanding gas or steam (which is applied directly in the design of rifles and cannon).

These are but a few of the hundreds of subjects simplified and explained in this complete reading course in methematics.

## Scratch a tire's face to give it extra miles

Life begins at 40,000 miles for many tires that might once have gone to the scrap pile.

THE MASKED man (above) is scratching the tread off a tire. He wears the mask so it won't scratch him back.

When he gets through this scratching, or buffing, the tire's face will look like the next picture (2), frazzled and treadless.

But—like any successful operation—it means years of new life for the patient. And these B. F. Goodtich recapping operations are successful, often giving a tire as many thousands of new miles as it had run before.

One of the reasons is that B. F. Goodrich recapping is supervised from the factory. Traveling experts

make sure that recappers know every step and use only approved materials. Among other things, the recapper must be expert at repairs—such as the one being made in picture 3. The repairs are made before the tire is recapped.

When the new tread is on, the tire goes into the mold for "baking." When it comes out (picture 4), the recapper knows that it will give mileage and service worthy of the name B. F. Goodrich.

If you are an "A" driver, recapping is the only way you may be able to get a "new" tire for many months. This is also true for many "B" and "C" drivers as well. So it's just as important that this "new" tire be right as it ever was. That's why B. F. Goodrich uses the same synthetic rubber in recapping that has already rolled up 4 billion miles for the all-synthetic B. F. Goodrich Silvertowns.

Help your country and help yourself, by getting your tires recapped in time. If a tire is too worn it cannot be recapped—so don't wait until too late. Have your B. F. Goodrich man check your tires now. The B. F. Goodrich Co., Akron, Ohio.

# LIGHTER MOMENTS with fresh Eveready Batteries

"It never fails . . . the minute I get in the bath, there goes the telephone!

"Keep your eye on the Infantry—the doughboy does it!" The doughboys are in every front line drive. Are you in on every War Bond drive?

MILITARY FIELD TELEPHONE EQUIPMENT calls for the kind of dependable power found in "Eveready" No. 6 Dry Cells.

That's why much of our production goes to the Armed Forces. The civilian supply is limited, so use yours wisely. However, after the war, there will be new and finer "Eveready" batteries...giving better

service, longer life.

The words "Eveready" and "Ignitor" are registered trade-marks of National Carbon Company, Inc.

Copyrighted misselful

We don't like to tell people that they'll have to wait to get a home telephone. We'd much rather say "yes" to requests for service. That's the way it always used to be.

But the needs of war still have first claim on available telephone equipment and on telephone manufacturing facilities and manpower. Delays in filling civilian orders just can't be helped.

All of us telephone people sincerely appreciate your patience and understanding in this war emergency.

FAKE MEDIUMS, wholesale bilkers of the public for years, are now stealing millions by trading on the grief of those who have lost loved ones in the war. Julien J. Proskauer (left), past president of the Society of American Magicians, and Theodore Hardeen, brother of Houdini and board chairman of the Magicians' Guild, demonstrate the old table-levitation trick, one of the more popular spiritualistic hoaxes. For a startling expose of this flourishing racket, read Helen Worden's story on page 67.

Be sure to give both old and new address,

"Ten years ago you and I worked at the same machines. We were both discontented. Remember the noon we saw the International Correspondence Schools' advertisement? That woke me up. I realized that to get ahead I needed special training. When I marked the I. C. S. coupon I asked you to sign with me. You said, 'Aw, forget it!'

"I made the most of my opportunity and have been climbing ever since. You had the same chance I had, but you turned it down. No, Jim, you can't expect promotion until you've trained yourself to handle bigger work."

There are lots of "Jims"—in war plants, offices, stores, everywhere. Are you one of them? Wake up! Every time you see an I. C. S. coupon, your chance is staring you in the face. Don't turn it down.

Right now over 100,000 men in industry and the Armed Forces are fitting themselves for the responsibilities and advancements of the Victory World through I. C. S. Courses.

You can join them, step up your "fire-power" on the production front, get in line for promotion in the Service, prepare for tomorrow! Mark and mail this coupon, and find out how.

SPECIAL TUITION RATES FOR MEMBERS OF THE ARMED FORCES

Copprignativament

### **Coming Next Month**

DESTRUCTION IN CAPSULE FORM comes off U. S. production lines at the rate of 500 cartridges a second. And this, mind you, is nothing but small-arms ammunition. Shells for big guns, torpedoes for undersea attack, and mines are something else again. This article tells about them all, with inside details about processes, explosives, and the various kinds of time fuses.

wide existence will be caused among the kiddies this Christmas when you produce the easily made toys described and pictured in full color next month. There's a hen that ducks her head, flaps her wings, and bobs her tail; a cowboy who rides a bucking bronco; a monkey that pedals a bicycle and tips his hat. Besides the pictures, there are working drawings, so you can start right in.

WAR-FRONT REPORT gives you a new line on the Browning automatic rifle, called the "BAR" by the battle-toughened Yanks who use it. You have read about this great gun from the point of view of production and home-front testing. Now Allen Raymond, famous war correspondent, gives a firsthand account of the way the Browning automatic fits into the rough-and tumble pattern of combat.

THE VICIOUS KINGCOBRA P-63, a deadlier, faster plane than its smaller brother, the P-39 Airacobra, is next month's pin-up in full Kodechrome color. It is a thrilling and indispensable addition to the beautiful series of airplane pin-ups already published.

INSPECTION BY MAGNETISM is accomplished efficiently in many war plants. Hidden defects are made visible by magnetizing iron and steel parts and spraying on a solution containing particles that will be held by the magnetic field built up at the edges of any fault. You can duplicate the method at home if you read this article.

KNOW-YOUR-ENEMY idea is hammered home in an article for builders of model airplanes. There are full directions for constructing a miniature of the German standard fighter plane ME 109-G—the familiar Messerschmitt. Accompanying these are working drawings and a photograph showing the completed model.

HUNDREDS OF OTHER PHOTOGRAPHS, drawings, and diagrams, and scores of other articles of scientific interest add up to an issue of unusual interest.

### Get Into a Busy Field With a Bright Peacetime Future

# BIG DEMAND NOW FOR WELL-TRAINED RADIO TECHNICIANS, OPERATORS

I will send you my Lesson "Getting Acquainted with Receiver Servicing" FREE, to show you how practical it is to train for Radio at home in spare time. It's a valuable Lesson. Study it—keep !t—use it—without

obligation! And with this Lesson I'll send my 64-page, illustrated book, "Win Rich Rewards in Radio" FREE, It describes many fascinating jobs Radio offers, tells how N.R.L gives you practical Radio experience at home with SIX BIG KITS OF RADIO PARTS I supply!

# My Radio Course Includes TELEVISION • ELECTRONICS FREQUENCY MODULATION

Think of the NEW Jobs that Television, Prequency Modulation, Electronics, and other developments will open after the war! I will train you to be ready to cash in when Victory releases the amazing wartime developments for peacetime uses!

### Many Opportunities Open for Trained Radio Technicians and Operators

There's a shortage today of capable Radio Techpicians and Operators. The Radio Repair Business to booming. Profits are large. After-the-war prospects are bright too. Think of the new boom in Radio Sales and Servicing that's coming when new Radios are again available—when Frequency Modulation and Electronics can be promoted—when Television starts ita postwar expansion'

Broadcasting Stations, Aviation Radio, Police Radio, Loudspeaker Systems, Radio Manufacturing all offer good jobs to trained Radio men—and most of these fields have a big backlog of business that built up because of the war, plus opportunities to expand into new fields opened by wartime developments. You may never see a time again when it will be so easy to get a start in Radio!

### Many Beginners Soon Make \$5, \$10, a Week EXTRA in Spare Time

The day you enroll for my Course I start sending you EXTRA MONEY JOB SHEETS that help show how to make EXTRA money fixing Radios in spare time while still learning. I send you SIX big kits of Radio parts as part of my Course, You LEARN Radio fundamentals from my illustrated, easy-to-grasp lessons-PRACTICE what you learn by building real Radio Circuits-and use your knowledge to make EXTRA money!

### Mail Coupon for FREE Lesson and Book

The opportunity war has given beginners to get started in Radio may never Bo take the be repeated. first step at once. Get my Lesson and 64-page illustrated book FREE, No obligationno salesman will call. Just mail Coupon in an envelope or pasted on a penny postal

NOW Is the Time to PATENT, and SELL Your Invention

Now, more than ever before, is the right time to patent your invention. Why? Because manufacturers everywhere presently engaged in war production are looking shead to the future by buying up patent rights now, so they will have new and attractive items to make and sell for givilian consumption as soon as the war is over. This is what happened during and after the last war. Hence, the smart thing for you to do is to look ahead to the future too. Protect your invention and your-self by applying for a patent now.

## Patent Guide Shows What To Do

Our 'Patent Guide for the Inventor' answers many important questions concerning Patents that inventors constantly ask. It tells what facts, details, drawings, sketcher, etc. are necessary to apply for a Patent; how to protect your invention through dated and witnessed disclosure; how to do this AT ONCE to safeguard your rights; how Patent Office Records can be checked to determine whether the invention is probably patentable before filing fees need be paid; discusses costs involved and a practical way these can be paid at the application progresses. It fells how some inventors secured financial backing, how many simple inventions have proved large commercial successes; how Patents covering improvements also can be profitably utilised and macketed; tells countless other facts of interest.

## Why You Need Expert Assistance

The Patent Laws were enacted for your benefit—to give you protection for the features of your Invention which are Patentable. But these features must be legally and concisely set forth in the form of "clasms." This phase of the procedure is so complex that the Patent Office advises the Inventor to engage a competent Registered Patent Attorney. We maintain a large staff—carefully trained registered patent attorneys—expert draftsmen—experienced searchers—to serve you. We have been serving inventors for more than 20 years.

## Take First Step Now

With the Patent Guida you will receive also Free a "Record of Invention" form which will enable you at once to establish the date of your invention, before you file your Patent application. This step costs you nothing yet may be vital to your success. Remember—in Patent Matters. ACTION is IMPORTANT, Delay can be costly, Mail the coupon in an envelope, or paste it on a penny postcard NOW

TRY FOR A Free art Course

Copy this girl and send us your drawing—perhaps you'll win a Complete ART COURSE FREE.

# FIVE PRIZES—five complete art courses FREE including Drawing Outfits (Value of each course, \$215.00).

FREE! Each contestant submitting a drawing of sufficient merit will get a grading and our opinion as to whether his or her talent is worth developing.

Vocational Training for talented artistic persons is of tremendous importance. Almost everything must be designed before it can be manufactured. Only talented persons can be trained as designers and illustrators. Splendid opportunities are available for trained Commercial Artists. Many of our former students are earning excellent incomes in both war and civilian industries. Here's an opportunity to test your talent FREE.

### RULES

Contestants must be amsteurs. Our students are not eligible.

- Maire copy of girl 514 inches inches high. Draw only the girl, not the lettering.
  - 2. Use only pencil or pen.
  - 3. No drawings will be returned,
- 4. Print your name, address (town, county, state), age, phone number and present occupation on back of drawing.
- 5. All drawings must be received by Nov. 30th, 1944.

Prize winning drawings will be selected by our faculty.

Boy Wer Sevings Bonds and Stomps regularly.

NOVEMBER, 1944

### Had Never Written a Line Sells Article Before Completing Course

"Before completing the N.I.A course, I sold a feature to Screenland Magazine for \$50. That resulted in an immediate assignment to do enother for the seme magazine. After gaining confidence with successive feature stories. I am now working into the fiction field. Previous to enrolling in the NIA, I had never written a line for publication, nor seriously expected to do 16"—Gene E. Levant, 116 West Ave. 28, Los Augetes,

# Why Can't You Write?

It's much simpler than you think!

O many people with the "germ of writing in them simply Scan t get started. They suffer from inertia. Or they set up imaginary barriers to taking the first step.

Many are convinced the field is confined to persons gifted

with a genius for writing Few realize that the great bulk of commercial writing is done by so-called "tasknowns," Not only do these thousands of men and women produce most of the fiction published, but counties articles on business affairs home and shop crasts, hobbies, suventions, human interest, social matters, etc., as well such material is in constant de-

FOR DISCHARGED VETERANS If qualified under the GL Bill, this training is available under gavernment Auspires.

mand Every week thousands of checks for \$25, \$50 and \$100 go out to writers whose latent ability was perhaps no greater than yours.

### The Practical Method

Newspaper work demonstrates that the way to learn to write it by

writing' Newspaper copy desk editors waste no time on theories or ancient classics. The story in the thing, Every copy "cub asses through the course of practical criticism-a training that turns out more successful authors than any other experience

That is why Newspaper Institute of America bases its will ing instructions on the Copy Desk Method. It starts and keepyou writing in your own home, on your own time. And apon the very same kind of actual assignments much daily to metropolitan reporters. Thus you learn by doing not by study ing the individual styles of model authors.

Each week your work is analyzed constructively by per twalwriters. Gradually they help to clarify your own distinctive stric We tog ston becomes easy absorbing. Profitable, too, as you as a the "professional" touch that

nels your material accepted by editors Above all, you can see constant progress week by week as your faults are cor-rected and your writing ability grows.

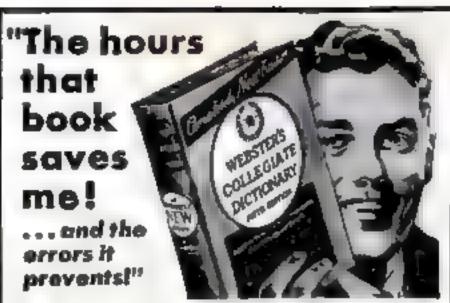

### Have You Natural Ability?

Our Writing Aptitude Test will reveal whether or not you have natural talent for writing. It will analyze your powers of observation, your immination and dramatic instruct. You'll enjoy taking this test. There is no cost or obligation Smpaper Institute of America One Park Avenue New York In N Y Chounded 1925 1

# HERE'S THE ONE PRACTICAL WAY TO TRAIN FOR BIG EARNINGS AHEAD IN RADIO-ELECTRONICS & TELEVISION

The offer I make you here is the opportunity of a lifetime. It's your big chance to get ready for a wonderful future in the swiftly expanding field of Radio-Electronics INCLUDING Radio Television, Frequency Modulation and Industria: Electronics. Be wise' NOW'S the time to start. No previous experience is necessary The Sprayberry Course starts right at the beginning of Radio. You can't get lost. It gets the various subjects across in such a clear, simple way that you understand and remember.

### I'll Show You a New, Fast Way to Test Radio Sets Without Mfg. Equipment

The very same Radio Parts I supply with your course for gaining pre-experience in Radio Repair work may be adapted through an exclusive Sprayberry wiring procedure to serve for complete, fast, accurate Radio Receiver trouble-shooting. Thus under Sprayberry methods you do not have one cent of outlay for manufactured Test Equipment which is not only expensive but scarce.

### Prepares You for a Business of Your Own or Good Radio Jobs ... Civilian or Military.

My training will give you the broad, fundamental principles so necessary as a background no matter which branch of Radio you wish to specialize in. I make it easy for you to learn Radio Bet Repair and Installation Work. I teach you how to install and repair Electronic Equipment. If you enter the Army, Navy or Marines my training will help you win higher rating and better pay.

### JUST OUT! FREE!

"Now to Road Radio Disgrams and Symbols"

explains in sample English bow to read and understand any Redio Set Diagram. Provides the quick key to analyzing any Radio circuit. Includes translations of all Radio symbols. Send for this PREE book now and along with it I will send you another big PREE book describing my Radio-Electrosic training.

SPRAYBERRY ADADEMY OF HADIO

Leaders in science and industry have long been saying, "Keep your eye on Plastics." But now the time for action has arrived. The future of huge possibilities has already begun. Developments in Plastics for hundreds of wartime uses have set the pace for revolutionary changes in peacetime production of thousands of products.

NG HANC

Today there's a big need in vital war production for those who are trained in Plastics. From one to a hundred articles made of Plastics must be supplied for every man in our fighting forces. Start training now in Plastics Engineering, in spare

time in your own home. Fit yourself for a responsible, well-paid position. Help to win Victory. And at the same time you will be preparing for even greater opportunities when the war is over.

There is scarcely an industry in which these so-called "miracle materials" will not play an important part. After the war many old materials, methods and skills will be replaced. Acquire the all-important "know how." Be in a position to step into one of the key jobs.

YOUNGAN LEARN WHILE YOU EARN

Turn at least part of your leisure time into money. Qualify at home for a larger income in an interesting career. Build greater security for your future in a vocation that looms large on the horizon of the new industrial era. Hours you might

otherwise waste can put you well on your way toward lasting success.

W

### Commander Pays Tribute to Photographer Harold Kulick

It is with deep regret that I have been informed of the death of Mr. Harold W. Kulick, war correspondent and photographer representing Popular Science magazine. Mr. Kulick was killed when an aircraft of this command in which he was flying as a photographer-observer crashed near its home base after returning in a damaged condition from an operational mission over enemy territory. To secure pictorial coverage of B-26 airplanes in action, Mr. Kulick willingly shared the risks of combat crewmen. His courage and devotion to professional duty in face of danger are a tribute to himself and his profession. His loss is felt keenly by all personnel of this command who had come to know him.-Samuel E. Anderson, Brigadier General, USA, Commanding IX Bomber Command.

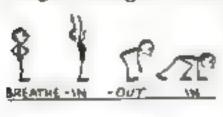

Readers of this magazine will remember many examples of the high artistic quality of Harold Kulick's work. Associated with writer Hickman Powell on the Popular Briencz war-front reporting team, he illustrated such outstanding articles as "The Kite That Smashed Berlin" (Mar. '44), "Chasing Echoes on a Destroyer Escort" (April '44), "What It Takes to Be a Thunderbolt Ace" (May '44), "A Fortress Lives to Fight Again" (June '44), and "Fighting at 425 Miles in Hour" (Aug. '44).—Ed.

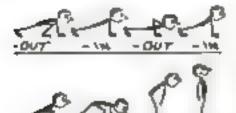

### Bombay Man Suggests a Toughen-up Exercise

IN a recent issue of Portlan Science, in the article "Can We Make Our Soldiers Tough Enough?" there are given 12 Army

FIRMS IN

OVE

exercises, which, after trying, I liked very much. But still I think that one of India's best exercises, the "Asan," has almost all the properties of these dozen exercises plus one, the breathing exercise, that is better than all the others. This is to be done at sunrise, with the

This model of a P-38, constructed by a reader of P.S.M., features retractable wheels. (Letter below)

body facing the sun. I wish to let Americans know about it, so I enclose a diagram showing how it is done.—M. J., Bombay, India.

### Model of P-38 Lightning Has Retractable Wheels

I've read Popular Science for many years and constructed many of the projects contained in its pages. Now I believe I have an idea that you might wish to pass on to others who build from your directions. I've never heard of any solid-model airplane kits being offered anywhere that include retractable wheels. I have built from kits and from scrap wood about the house; and I like to have the models stand up while on exhibition and to be able to hide the wheels when holding the model out of a car window in "flight." I used candy-sucker sticks as the struts.—J. R. L., Pueblo, Colo.

### P.S.M. Hoarder Finds a Way to Aid in Paper Drive

If I had been asked to turn in my car for scrap metal, I would have been less shocked than I was when you people suggested that I should give up my old copies of P.S.M. for the waste-paper drive. I ranted around home about it, pointing out to my longsuffering wife that the back numbers constituted the best reference library a man could own. I simply couldn't let them go. Then the brains of the family came across with the swellest idea since the invention of the sipper. She said, "Why don't you go through all the issues, and if there are any articles or pictures you particularly want to save, just cut them out? It won't hurt the old-paper value of what's left." Well, I did just that—and presented a tidy poundage of paper to the salvage drive.-D. S. W., Memphis, Tenn.

### You Might Try This When You're Lost on a Lonely Island

PERHAPS some of your readers would like to tackle this one. A group of shipwrecked sailors, wishing to know the approximate latitude of their island, constructed a pendulum from the anchors and cable of their lifeboat, and hung it from the top of a tree. Then the pendulum was set in motion, At the end of one hour, the pendulum appeared to have rotated three degrees in a counterclockwise direction. Were they north or south of the equator, and what was their approximate latitude? As their navigator possessed a chart, he could figure their location.-C. E. M., Lor-

ain, Ohio.

This is a variation of the celebrated Foucault pendulum experiment. The apparent rotation of the pendulum's plans of swing would be counterclockwise, as required, in the southern hemisphers. Applying the formula found on page 439 of

"Physics for College Students," the latitude would be approximately II degrees south, or about the latitude of the Solomon Islands.—

### Modern Abolitionist Wants New Term for Horsepower

I am writing this letter in the hope that it may help publicize an idea of mine. I wish to form the SATHSBT, or the Society for the Abolition of the Term "Horsepower" and Substitution of a Better Term. "Horsepower" in these days of high speeds and high altitudes seems to me to have been outmoded. Years ago, when the first automobiles raced along at the incredible speed of 12 to 15 m p.h., such a term as "horsepower" was suitable, for a team of horses, if bred and trained right, could easily pull a carriage at such a speed for a short time. But on Dec. 17, 1903, this term received its first blow, for on that day the Wright brothers flew the first heavier-than-air machine successfully; and what horse could have pulled it fast enough and long enough to make that possible? Who will help promote the S.A.T H.S.B.T.?-W. B. R., Atlanta, Texas.

State

City or Town. .....

A supercharger supplies combustion oir at greater density, permitting increased engine power,

charger's sole purpose is to increase engine horsepower.

Although it takes power to pump air with a supercharger, the result is a dividend of free horsepower far exceeding the investment. Flight at high altitude is impossible unless the rarefied air is first compressed, while in a Cyclone 9 at take-off, 100 HP spent to drave the supercharger rewards the engine with 500 additional horsepower at the crankshaft.

Superchargers, like Cyclones, pay their way.

Eyclones and Whirlwinds Light Compact Powerful

Aircraft Engines

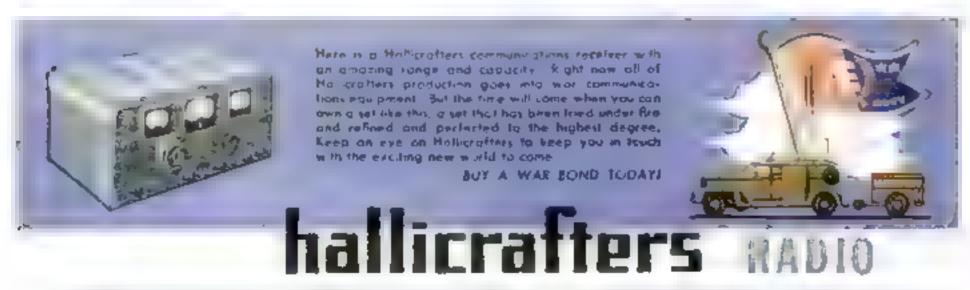

### MEET YOUR NEW NEIGHBOR . . .

Your new neighbor, half way around the world, will be closer than ever with improved short wave radio communications. For instance there will be new light on "darkest Africa" and descriptions by explorers of strange tribal customs as pictured above will be sent around the globe through the magic of short wave radio.

Here's a whole new world open to you. An African jungle ceremony is only one of thousands of universally important and exciting events that will be brought home through good short wave receivers. Hallicrafters' equipment reaches far

out and brings in high quality reception from the most obscure and distant points.

Famous as builders of "the radio man's radio", Hallicrafters will continue to make the finest short wave equipment available. Wherever you are... whatever you do, be it business, science, industry, government, teaching, you'll want to be quickly, reliably and regularly informed of fast breaking events in the post war world. For you and your particular needs there will be a Hallicrafters receiver... to help you meet and know your new neighbor, to help secure the peace we fight for.

### Ball Going Up Doesn't (Does) Stop Before Coming Down

I would like to answer JMK. in Readers Say. The ball thrown up does not rest momentarily. That is an impossibility. Any object thrown into space always describes a parabola. At its highest point, the object changes direction, and its instantaneous velocity at that moment is zero. Problems of this nature are treated in detail in physics and calculus.—S. E., Linden, N. J.

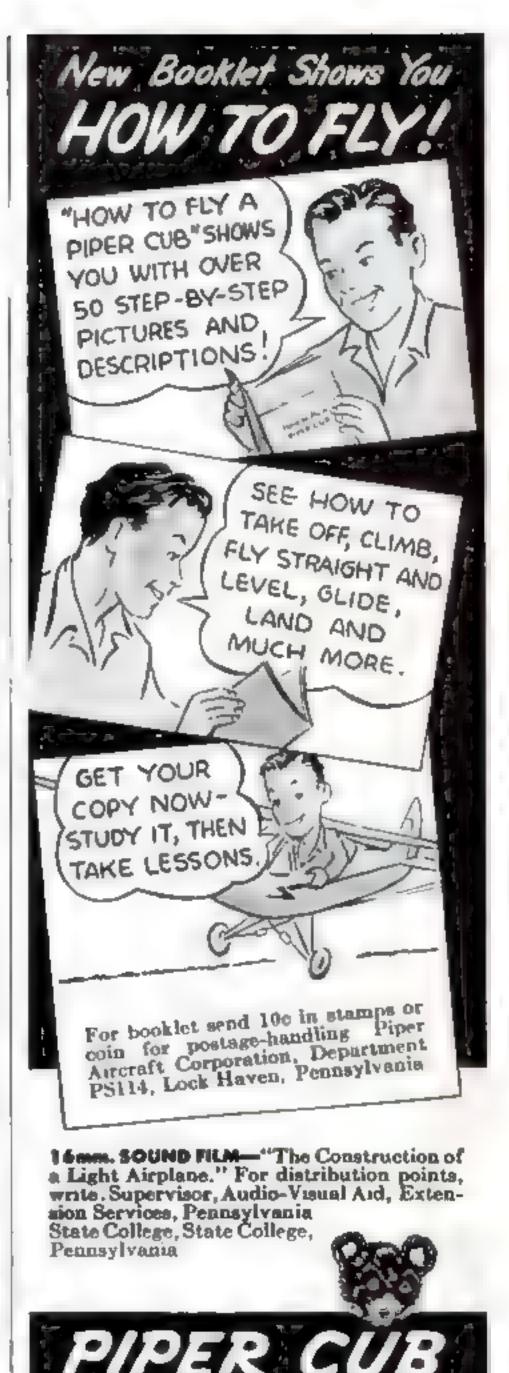

In answer to JMK., the answer is evidently yes. The flaw in his reasoning was that a body stops or comes to a rest when all the concurrent forces on it total zero. The condition comes about when the vector force, representing gravity, has increased to such a point that it exactly equals the decreasing vector quantity representing the thrust from the ground. Though this condition occurs for an infinitesimal part of a second, nevertheless the body has entered a state of rest, i.e., equilibrium, and can correctly be considered to have stopped.—H. D. B., Great Neck, N. T.

# Happy Ending to a Story with Two Characters

I am just dropping a line in to say how much I enjoy Popular Science. When the first of the month comes around, I follow the postman all over half the block begging him to tell me whether or not he has my P.S.M. before he gets to my house. Today I begged him to tell me if he had it and he finally gave it to me. I am just 12 years old, but I look forward to every issue. I sure do enjoy those articles about airplanes, and also Readers Say. Could you possibly publish

something about what the Signal Corps is doing at Fort Monmouth, N. J., as my father is in the Army there? I hope you will print this, as I would like to show it to my postman. How about a cartoon of me looking over his shoulder?—C. D. L., Richmond, Vs.

Hers you are.—Ed.

In the Shops of Coyne

Prepare now in America's leading field for a good job that will be a good job, with a real future when the war is over. Trained Electrical men needed now, They will be needed probably more in peace-time. Don't be one of the untrained men that have to compete with thousands of other untrained men later. Got your electrical training now and be ready for real opportunities. Right now, I'll include extra training in Industrial Electronics at no extra charge.

### Job Help After Graduation

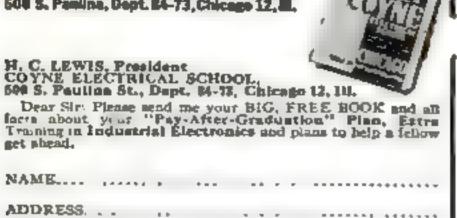

Many ambitious fellows do part-time work to belp out with fiving expenses while training for big opportunities in Electricity. If you need this part-time work, my employment Manager will help you get it. Also, lifetime employment service after graduation.

If you are short of money I'll finance your training . . . then you can take 12 months to complete small monthly tuition payments starting 60 days after your 12 weeks' training period la over.

Mall coupon NOW for my BIG, FREE BOOK called "Electricity-Gateway to Opportunity!" It's packed with facts and pictures of students at work in my big shops. # PREPARE NOW TO GO ALONG!

Plastics, already proved in war, demonstrate their many advantages and varied uses. Now the plastics industry looks forward to the postwar period when they will be used in countless new ways... improving old products, creating new ones. A growing industry needs men to grow with it. That's why plastics offer remarkable opportunities to persons of ambition and foresight.

LEARN AT HOME—You can learn plastics in your spare time at home without interrupting your present work. The Plastics Institute has developed a thorough, easy-to-understand course of training, requiring no previous technical experience. It offers complete, authoritative training based on industry requirements.

FASCINATING COURSE—The lessons are readily grasped and practical. Every step is made clear with graphs, diagrams, pictures. Actual specimens of plastics materials are furnished. A bi-weekly bulletin, "Plastics Trends," keeps you posted on new developments.

COMPREHENSIVE—Learn the various phases of plastics from this course... materials, designing, molding, fabricating, estimating and plant management. Acquire a basic knowledge of plastics that can be invaluable in preparing you to take your place in this great new industry.

EXCLUSIVELY PLASTICS—The Plastics Institute is America's oldest and largest plastics educational organization which devotes all of its facilities exclusively to plastics. It is held in high esteem by members of the plastics industry. Many of our graduates hold responsible positions in the plastics field,

START YOUR FUTURE—TODAY! Mail the coupon below now! We will send you an interesting booklet filled with valuable information on plastics and tell you how, at small cost, you can prepare for a career in this important industry. Don't put it off! Mail today!

# **Now She Shops** Without Painful Backacha

Many sufferers relieve magging backache quickly, once they discover that the real cause of their trouble may be tired kidneys.

The kidneys are Nature's chief way of taking the excess acids and waste out of the blood. They help most people pass about \$ pints a day.

When disorder of kidney function parmits poisonous matter to remain in your blood, it may cause nagging backache, rheumatic pains, leg pains, loss of pep and energy, getting up nights, swelling, puffices under the eyes, headaches and dissiness.

Don't wait! Ask your druggist for Donn's Pills, used successfully by millions for over 40 years. They give happy relief and will help the 15 miles of kidney tubes flosh out poisonous waste from your blood. Get Doan's Pills.

### NO EXPERIENCE NEEDED

If you are at all mechanically inclined—that is to say—can hold and use tools—then you have all of the qualifications required for becoming a big money-earning home appliance repairman. It does not matter if you have not had a great deal of schooling or had no previous training along these lines. Age is no barrier . . . nor is any minor physical handicap.

### Read What Other Students Say

I really believe your course the best investment a mechanically minded man can make.—Claude E. Allen, indianapolis, ind.

Your course on Appliance Servicing is the most complete and up-to-date I have heard of .- Frank Kremen, Tarentum, Penn.

I have received your Course in Appliance Repairing and I must say I am well pleased with same. I am only sorry I did not have said course some years ago. I have learned so much more through this course I would not part with it.—Charles Schwara, Hamilton, Ohio.

The Course in Appliance Servicing arrived a few days ago. Want to take out a few minutes of my valuable time to let you know that this is just what I have been looking for ever since I opened up my Fix-It shop. I must admit that you told the truth when you said that it contains quite a bit more information than I bargained for.—

P. J. Brett, Sebring, Ohio.

I am a mechanic for the Western Union Telegraph Co. Three days after receiving the lessons in refrigeration I samed the exact cost of the course.—Henry S. Lee, Washington, D. C.

### PREPARE FOR THE FUTURE

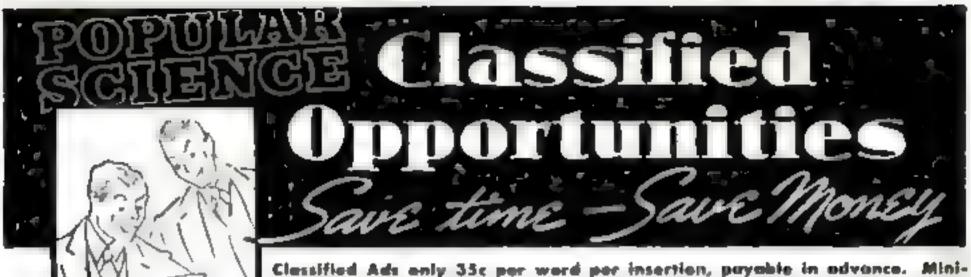

If now in war work, start your home appliance repair business in your spare time and be set with a business of your own when the war is over. You don't need elaborate fixtures or expensive equipment to be a successful repairman Operate from your garage, basement, vacant store, etc. Work as many hours as you wish the home appliance repairman is his own boss. It's a profitable occupation for on many types of repairs it is usual for a repairman to charge on the basis of \$5.00 to \$6.00 an hour! Preparated and make sure of tomorrow's future.

### New Course Tells All

Profusely illustrated, our new course shows you in simple, easy to understand language and drawings how to make each repair on refrigerators, vacuum cleaners, washing machines, motors, etc. Explains and gives you a working knowledge of electricity, welding, nickel plating, etc. Shows you how to build the power tools you need and how to solicit and keep business coming to you. Not a theory course but an honest to goodness course written by and used by repairmen the country over. Price of course is so low that the savings on your own household appliance repairs will quickly pay for it. Act now!

# Finger-tip Control - FROM FURROW TO HARVEST

The numbered days between frosts are crowded with lactors that make the crop. Power, successfully applied on the farm, is designed to out-race the seasons... to tend broader acres in fewer man-bours against the uncertainties of weather.

On more efficient tractors, and on the implements they pull in series, HYCON hydraulic systems can give ease—lessen fatigue through Finger-Tip Control—to the heavier jobs of farming more acres faster.

In diversified applications of power on the mechanized farm, HYCON units can take over many back-breaking, everyday chores. On many types of new equipment they can actuate lifting, steering, braking, and other operating devices...can provide the reins to control horsepower barnessed to lighten the work of man.

When industry turns to the building of new implements for modern agriculture, compact power units, engineered and patented by the makers of HYCON, will help to do many hydraulic jobs better.

Let's All Back the Attack-Buy More War Bonds

### HYCON Triumphs in Air Force Test

In 2 and 2 of the rest in the 6000 per all pressure to seat Weight have, one HYCON Strate, ower part from disputation the blistering heat of 160 degrees and the bitter cold of 65 degrees below zero for 550 continuous hours of operation. When no longer restricted by wartime needs, this revolutionary pump will do a great many hydraulic jubs between

#### THE NEW YORK AIR BRAKE COMPANY

410 LIXINGTON AVENUE, NEW YORK 17, N. T.

COPPE OUT \$44. THE NEW YORK IN BRAKE CO.

In this typical "church" of a fake medium conceived by our artist, incense candles and cheap, colored prints of Christ are used to create a religious atmosphere. A certificate, prominently displayed, testifies to the medium's admission to the ministry of a spiritualistic cult. The customary "denotion" is 50 cents

## By HELEN WORDEN

HIS is a boom time for spirit crooks, mind readers, and phony dealers in the occult. Their industry for the past few years has victimized millions for a "take" that has been estimated at as high as \$200,000,000 a year. Thousands of men and women calling themselves mediums are operating in the United States today. No city is free of the activities of these most contemptible confidence crooks, for the most part preying on those bereaved by the war, or touched by its ravages.

The war has given these soul chiselers a fertile field in families that have suffered loss, or fear the loss, of loved ones. In the victims is the hope of life after death and a desire for demonstration of the supernatural. And it's a sorry rooking they get

'Spirit writing' is the medium's stock in trade. Using some trick to read the supposedly concealed question her visitor has written, she numbers both sides of two slates, one to four, with chalk

With her victim already "holding the bag," she inserts the slates and chalk, the latter so that the "spirit" will have something with which to write the answer, in handling the slates, she holds her thumb on slate "four"

their most sacre! feelings exploite! by confidence men and women, usually for small sums but somet mes for fortunes once they have been built up and have fallen for the rack t. This is frequently done in the name—t religion.

# HOW FAKERS READ MESSAGES SEALED IN ENVELOPES

One of the simplest ruses employed by take mediums to demonstrate their "psychic" powers is what is known to the trade as the "alcohol-cushion" trick, Seated at a table on which lies a cushion, this medium has concealed in her left sleeve a rubber alcohol-spray butb. With her right hand she selects one of the envelopes in which her victims have sealed their written questions. Placing the envelope on the cushion, she presses her left arm on the table, sprays the envelope, and thus makes it transparent enough for the enclosed wrifing to be read. Income kills alcohol ador, dim lights hide any slips

As a newspaper reporter, I have come in contact with the tragic results in the wake of these phonics—suicide, disgrace, and misery to those who have listened to the spirit crooks only to learn later that they have been duped. By personal investigation

I have seen their barefaced trickery in operation.

At the outset, let me say, there are many sincers spiritualists who believe in life after death and are constantly seeking proof. But these do not practice trickery for gain or give advice on future conduct, business deals, and romances. Those rackets are for racketeers.

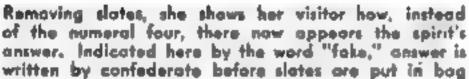

My investigations were made in a party of four, which included Julien J. Proskauer, famous magician, a former president of the Society of American Magicians and now public-relations director of the Magicians Guild, the professional magicians' organization. He is internationally known for his writings on spirit fakery, and especially for his book entitled "Spook Crooks!" Also in the party was Rose Mackenberg, special investigator of spirit crooks for the late Harry Houdini.

We selected two addresses. The

POPULAR SCIENCE

HOW IT'S DONE OSLATES ARE INSERTED IN PAPER BAG SLATE BEARING NUMERALS 1 AND 2 SLATE BEARING NUMERAL 3 AND FAKE" THUMB PRESSURE IS RELEASED TO ALLOW SHEET OF SILICA BEARING NUMERAL 4 TO DROP INTO BAG TOGETHER WITH CHALK

Actually what has been accomplished is nothing more than a very elementary version of the old false-bottom trick. The silica sheet is left in the bag; but, being extremely light, it is undetected by the victim

first was in an unprepossessing tenement building. There we were to visit a medium whom we shall call Laura, although that is not her real name. The hall was dark and the steps steep. At the head of the stair were two signs. One directed the way to a musical-instrument repairman. The other read, "Rev. Laura ————. Turn to your left." Miss Mackenberg and I walked ahead.

An attendant waited at the door. In one hand she held a basket for the contribution;

## Magicians' Supply House Sells Information on How It's Done

Below are condensed descriptions of a few items taken from a catalogue of Nelson Enterprises, Columbus, Ohio, which sells a complete line of equipment for magical and entertainment purposes only.

> ENTRANCED MEDIUM TRUMPET SEANCE. How

the medium, securely bound, enters a trance, calls spirit guides to passess his material body, then through a trumpet gives names of spectators, messages, and answers to questions. Apparatus with instructions—\$17.50.

MIRACLE TABLE. Last word in mechanical devices for private reading work. The performer has instant knowledge of contents of paper held in the spectator's hand. All the performer needs to do is to open the drawer and the duplicate of the writing is automatically placed in front of him, properly shielded from the spectator's eyes, Price, \$75.

THE MEDIUM'S TEXTBOOK. The medium takes the platform, opens her Bible, reads a few paragraphs therefrom, and answers sealed billets. The Bible, which is a Bible in appearance only, permits her to learn instantly the contents of each envelope the minute she places if on the open pages of the book. No chemicals. Leatheroid cover, gald-stamped, with red edges. A master effect. The price, complete, is \$20.

#### "CONFESSIONS OF A MEDIUM."

A book of mediums', psychics', and healers' certificates, showing how they get their certificates, which make them Immune from police interference. Tells how people enter the psychic field, how they conduct their business for profit, how simple it is for mediums to give real "knock-out" facts without preparation, writing, or apparatus of any kind. A complete explanation of three of the cleverest billet and private reading tests ever devised. Sold with the distinct understanding that any information derived will be used for legitimate purposes only. Price, \$10.

Tilting or raising a table is another of the more popular hooses used by takers to bilk the credulous. In this "levitation demonstration," in which six or eight people ordinarily would be seated around the table, Julien J. Proskaver [left] and Theodore Hardeen (right), both former presidents of the Society of American Magicians, pose os a medium's secret assistants. Wearing wrist bands fitted with metal hooks (below), they, like the real victims, put their fingertips on the table, being sure, however, to hook the metal pieces under the table's edge. When the medrum gives the magic signot, they raise their hands and, miraculously enough, the table also rises into the oir with all hands "aboard"

in the other, a box for the questions. Beside her, on a long table, were stacks of small paper slips, cheap, thin envelopes, and pencils. We were told to write our question or questions on a slip of paper, seal the paper in an envelope, write our initials on the envelope, and drop it in the box.

Mr. Proskauer placed a five-dollar bill in the contribution basket. The attendant put down her basket and the box, picked up the bill, and handed him back two fifty-cent pleces and four one-dollar bills. He then dropped two dollars in the basket for the four of us. This 50 cents spiece was not required of us as a "fee"; It was merely "accepted" as the customary "donation."

All but five seats were filled. Laura, a thin, worried-looking woman, smartly dressed in a dark gown with long sleeves, sat at a table at the front of the room. Our seats were in the first and second rows. Later, Mr. Proskauer said they were the best we could have had for observing Laura's specialty, the alcohol-cushion trick.

On her left stood what appeared to be a small cushion, perhaps a pincushion, on which she casually rested her right hand from time to time. On her right was a box similar to the one the attendant had been holding at the entrance.

As we took our places, the attendant came in, placed the box of collected questions on the table, and carried away the

other box for the questions of later arrivals.

The medium reached for one of the envelopes, held it a moment as if in meditation, and rested it on the cushion as she intoned:

"And this voice which came from heaven we heard, when we were with him on the holy mount. The second epistle of Peter, chapter one, verse 18."

She paused a moment; her eyes appeared closed, downcast.

"L. C. D.," she called, "you are troubled. Don't worry. Harry is always at your side. Let Mary go her way. Right will triumph. Be still."

A middle-aged woman, dressed in plain but good clothes, nodded happily. "Thank you," she said and walked out. Immediately another seeker for word from the "spirit world" took her chair, coming in from the crowd that waited at the door. Business was good.

It was some time before my questions were reached. I had written three:

"Shall I stay in New York or go back home?"

"Is Charlie happy?"

"Will glasses help my headaches?"

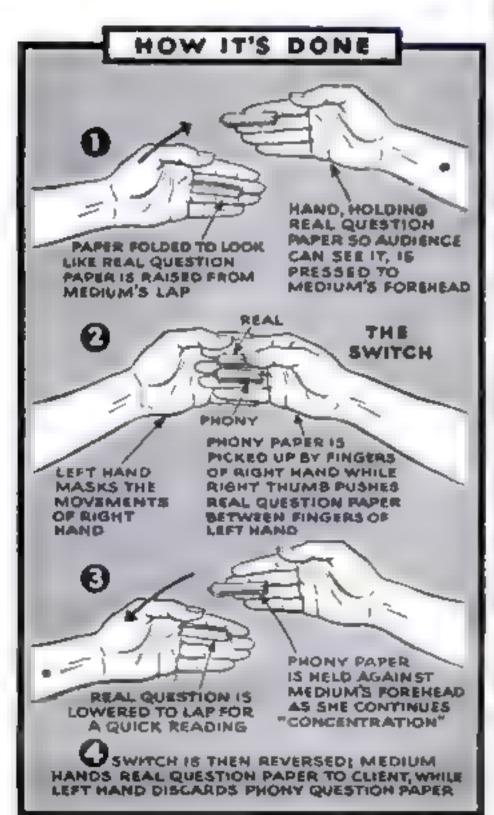

The envelope I had initialed "J. J." for my assumed name "Jennie Jones." A woman in the rear was crying quietly when Laura came to my envelope.

"J. J.," she said, "raise your hand please." I raised my hand. The "pastor" went into her routine, or the "grinds," as it is called

professionally.

"I have many things to say and to judge of you; but he that sent me is true; and I speak to the world those things which I have heard of him. St. John, eight, verse 26." After a moment's pause, she singsonged: "There is a man standing at your side. His name begins with C—Ch-Ch-Charlie. He wants to tell you something."

There was a (Continued on page \$13)

The victim writes a question on a piece of paper and signs his name or initials. These questions usually concern love, money, marriage, business, illness, or travel. In war years, many of the questions concern loved ones lost at the battle front

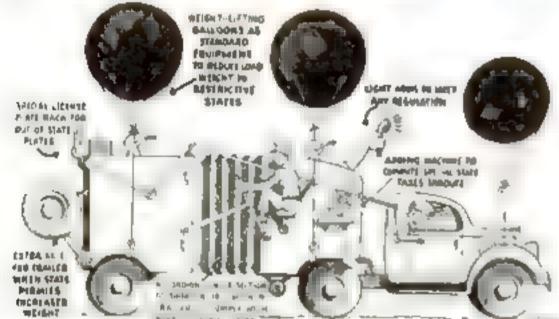

The paper is then compactly folded by the victim and handed to the medium, who promptly goes into her hocus-pacus of establishing a contact with the spirits of the "other world," In the jargon of the "speak crooks," this is known as the "grinds"

3 Holding the folded paper between her fingers, the medium presses it to her forehead, the better to "absorb" the messages from the distant spirit world. By the simplest sleight-of-hand (diagram at left) she reads the question, gives an answer, returns the paper, and smilingly collects her maney

JUNGLE MORTAR, which throws the 60-mm, projectiles seen beside the gunner, is especially adapted to combat use in South Pacific land areas. An extremely light and portable weapon, it can be carried slung over a soldier's back. The projectile is not fired by dropping it into the barrel, as is usual with mortars; instead, a lanyard-operated trigger sets off a percussion primer located at the center of the tail fins. Using no triped, the mortar may be positioned against firm earth. tree roots, or any other convenient brace for absorbing the recoil.

The POSTWAR TRAILER to fit all State Laws

All-STATE TRAILER design has been evolved by harassed engineers of the Fruehauf Trailer Co., Veruon, Calif. If such a vehicle were mechanically possible, it would meet all the conflicting requirements of the various states as to load, length, lights, number of wheels, placing of license plates, etc. Variations in automobile laws are illustrated by the fact that, while in New York trailer length may be 50 feet, in Illinois the maximum allowed is 35 feet.

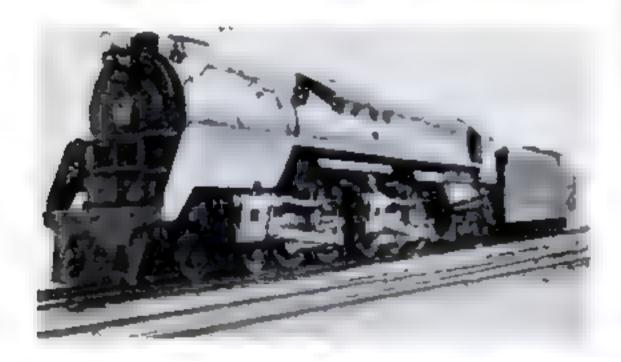

NEW TACK-TICS. Latest device of the AAF for annoying enemy airmen is to sow their siriled runways with puncture-producing barbs. Three types are used the four-pronged "big boy" (left), the "Christmas tree," and the single barb. Dropped from boxes carried in bomb racks, the barbs always land with a point up to wreck planes taking off or landing. They are also sown on roads ahead of truck columns

NEW OXYGEN EQUIPMENT, designed to minimize the short-

designed to minimize the shortcomings of older types, will enable combat airmen to fly above heights of 40,000 feet without ill effects. They could even live at 50,000 feet for brief periods. Necessary for prevention of anoxia, or oxygen-want, is enough atmospheric or mechanically induced pressure to force air into the flyers' lungs. It is outside air pressure that accomplishes this at altitudes in which man normally lives. The new equipment simply puts oxygen under sufficient pressure to compel its entry into the lungs. The heart of this aid to high flying is a "diluter demand breathing regulator" connected with the oxygen mask. The pilot merely turns a dial as he goes higher.

SMOOTH JOB is a new-type steam locomotive especially designed to pull heavy loads of freight at high speed on The Pennsylvania Railroad, Weighing over a million pounds, and, including its tender, 124 feet seven inches long, the glant can draw a train of 125 loaded cars at more than 50 miles an hour. A double set of cylinders is used, the forward driving two pairs of wheels, the second giving power to another three pairs. High pulling power is maintained up to 70 m.p.h.

GLASS LAND MINES that. because of the absence of metal, the enemy can't locate with magnetic finders or set off with electronic detonators, have been developed by the Army Ordnance Department and engineers of the Owens-Illinois Glass Company, Toledo, Ohio. The mines have been kept a close military secret for many months, and as yet no details of their design or construction have been released. They have proved effective against tanks, trucks, and other vehicles. In addition to glass, plastics are used for some of the internal parts.

Nobody Knows How They Do It, Yet-

#### GLUES NOW PERFORM

# MIRACLES BONDING

By GOLD V. SANDERS

HEN glue is tough enough and reli-able enough to hold fighter planes and bombers together under the terrific stresses of combat, it is time to face the fact that a new era of construction has arrived. We are using glue in place of rivets to build combat planes; in place of bolts, screws, and nails in building PT boats, landing craft, ship timbers, and structural arches. And don't imagine there is anything ersats about all this; we are using glue for war equipment for the one reason that it is better.

The science of chemistry produced these miracles in bonding, and the urgency of war brought them into a myriad of vital uses alFIRST THE GLUE S PLACED BETWEEN THE MATERIALS TO BE JOINED

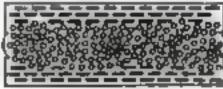

. THEN SOLIDIFIES, FURTHER HEATING WILL NOT SOFTEN IT

most overnight. The employment of these new glues in equipment for war is staggering in extent, and the promise for new civilian uses is one of the brightest of postwar prospects.

Glue has stepped boldly out of doors and into entirely new fields, fortified with new

#### WHAT IS IT THAT MAKES GLUE STICK?

UNCURED

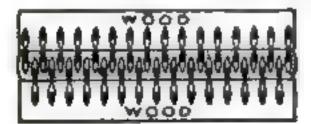

PARTLY CURED

#### IS IT MOLECULAR ATTRACTION? . . .

Experts have had conflicting theories as to why glue sticks. Same maintain that molecules of the adhesive and of the materials joined are attracted to each other, thereby forming a solid,

The diagrams above show the theoretical process of this "chemical weld." The first indicates the glue as first placed between two slabs of motorial. Next is shown the early molecular acalmost industructible band while setting or curing tion; third, interlocking molecules of the band

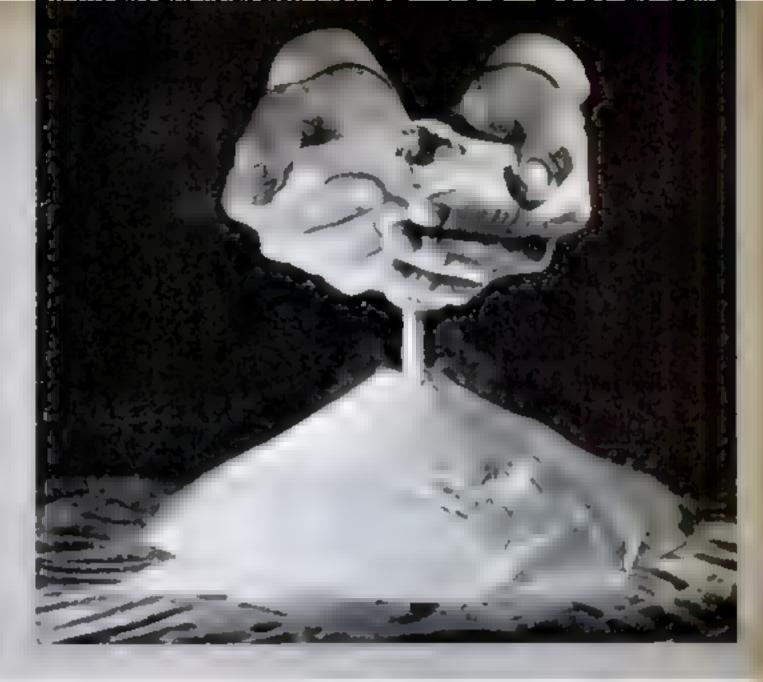

#### ... OR IS IT POLAR ATTRACTION?

On the other hand, some molecules are polar, having north and south poles like magnets. These attract other polar molecules (north to south). Hydroxyl molecules of wood, for example, are polar, and act as points of attraction for polar molecules of protein or resin glues. This may be the reason for adhesion

#### MATERIALS

This powder is one form of synthetic resin glue mode from coal products. Flowing freely through the supped hands of the right, it is obviously for from sticky But if you put a thin layer of it between two pieces of moterial to be joined, and then heat it under pressure, a miracle will accur. First the powder mells, then it hardens while it is still hat. No amount of heat can soften it again, and the glue becomes both waterproof and fungus proof; besides which it forms on enduring bond of prodigious strangth By varying the formula of this synthetic glue, its use between different moterials is extended indefinitely. but the bond made continues to be proctically a weld. The addresive ellustrated and described here is Plankan, which is one of the numerous trade names under which synthetic resin glues are manufactured and sold.

strength plus ability to stand all kinds of weather, soaking in salt water, even boiling We have adhesives now that will bond all kinds of materials together—metals, wood, glass, rubber, plastics—with bonds stronger than the materials themselves in many cases. Gluing things together is the uitimate in simplicity, and now that we have adhesives that are just about perfect for all purposes, we can build many things more cheaply than ever before. Some experts say we can build airplanes 10 times as fast as before and at one tenth the former cost.

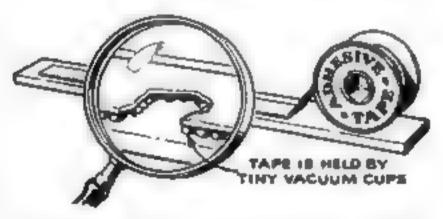

These new adhesives are all synthetic

#### THIS IS HOW SOME COMMON ADHESIVES WORK

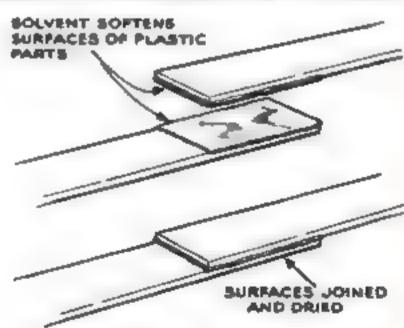

forming hooks in lath openings.

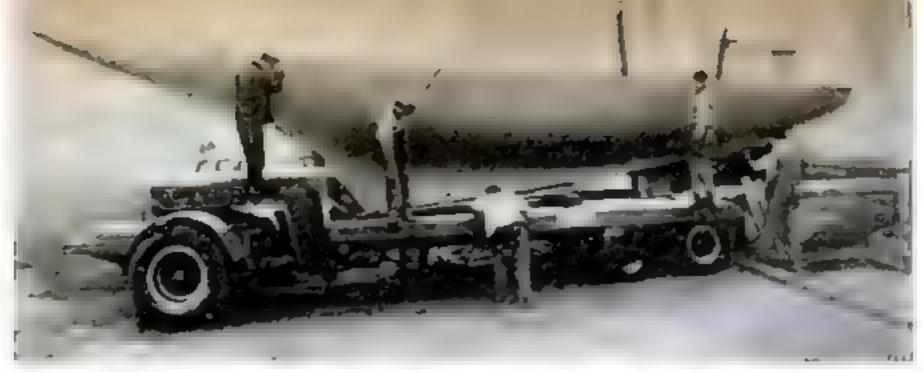

Formerly It was believed that glue made its band in the same way; this has been disproved

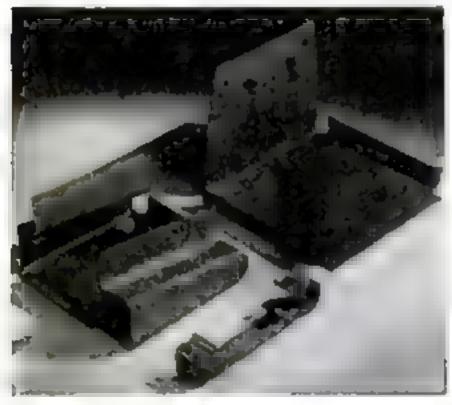

ADMESIVE TAPE maintains its grip through atmospheric pressure. Numerous vacuum cups are squeezed together when the tope is applied under pressure, and held securely by the weight of the surrounding atmosphere

THERMOPLASTICS are joined by applying a solvent such as acetone to the surfaces that will come together. This softens the material itself, and the two sheets are pressed together until dry. The material becomes the adhesive

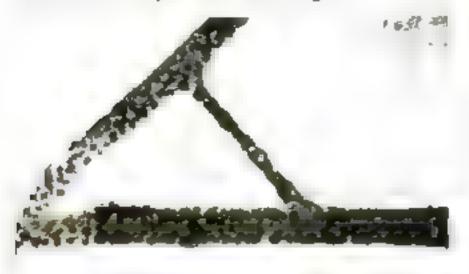

NEW METHODS of manufacture are made possible by today's adhesives. Here is a sailboat hull 38 feet lang, malded into one piece from nine plies of makegony bonded into one piece with waterproof bakelite phenolic glue. The hull was virtually "cooked" into shape. Added advantage is: no seams to calk

NEW MATERIALS are created with the aid of resin gives. These are airplane parts made of fabric laminated with the new adhesives and molded to shape, They're strong and durable as metal

#### ELECTRON MICROSCOPE MAY SOLVE MYSTERY OF ADHESION

The tiny black spots in the electron-microscope picture below are believed to be molecules, some unexplained action of which accounts for the adhesive power of glue. The magnification (100,000 diameters, greatest ever achieved) shows a minute particle of vinyl chloride, one of the synthetic resins from which many of the modern glues are made

products of chemistry and are very closely related to the plastics. They are derived from coal, oil, alcohol, and limestone; older glues came from hoofs and hides of animals, cow's milk, or vegetable matter.

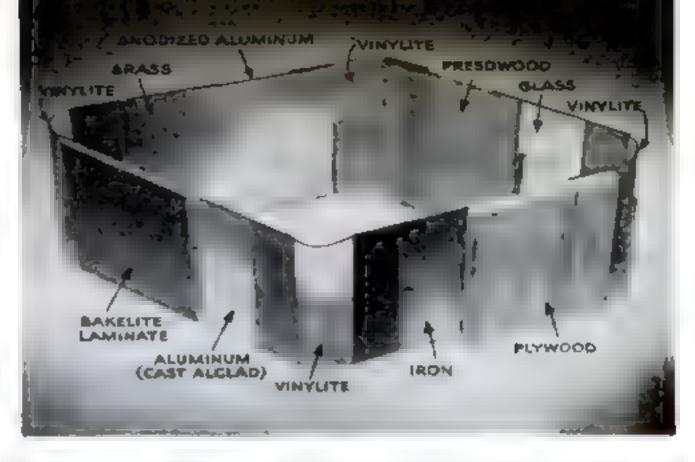

The acientists who have created these amazing new adhesives and the factory experts who use them in so many practical ways are still largely in the dark as to why they stick with such tenacity. The whole question of why glues hold things together has been intensively examined in the course of research and development. Better and better adhesives are being produced all the time, but still there are only theories as to why this or that one does the miraculous things that it does.

However, the commonest explanation of all has been thrown overboard. This is the idea that glue fills the pores of the materials being joined and thus forms many small hooks or spurs that act as anchors when dried hard. This theory had to be abandoned when it was discovered that the smoothest materials could be joined with the strongest bonds. Microscopic examination of glue lines further showed that there are not nearly enough books or anchors to account for adhesion even in gluing soft woods. In gluing glass to glass or metal to metal, there obviously is no such penetration of glue into the material as to account for shear strength of 4,000 pounds to the square inch.

All presently held theories are based on physical or chemical reaction between molecules in the curing or hardening process. The new resin adhesives are cured by polymerization— the clumping of small molecules to make larger molecules which form a new compound. This is brought about either by application of heat or by the addition of a catalyst or chemical setting agent, as in the case of the so-called cold-setting resins. In either case the reaction that takes place changes the resin into a different com-

#### ALL KINDS OF MATERIALS CAN BE BONDED

This is a show-off piece that demonstrates the versatility of synthetic-resin adhesives. By modifying formulas, almost anything can be bonded to itself at to anything elsevoluminum to plastics to wood to glass, and so on. The ring shown here was glued with various modifications of Cordo-Bond

pound by the union of two or more molecules. This same union of molecules, or something akin to it, evidently takes place also between the adhesive itself and the materials brought into contact with it during the curing process. This would be a sort of "chemical weld." But no one theory would seem to account for all of the remarkable bonds that are being accomplished with virtually all kinds of material.

Champion of all in waterproof qualities is phenol-formaldehyde glue, derived from phenol, which is carbolic acid. This is the stuff that has stood six years of repeated soakings at the U.S. Forest Products Laboratories and come out with a report card that stated that the glue showed no more deterioration than the wood it joined. This is the stuff that stands boiling without giving way. Once it is set, no amount of heat can melt it. A large family of plastics also is derived from this same phenol-formaldehyde. Other synthetic-resin glues also classed as waterproof under Army and Navy

specifications are melamine, urea, resordinol, and furane.

Just how resistant these glues are to water and wetness may be judged by these typical wartime uses of wood glued with them: torpedo boats, landing barges, all-plywood invasion craft, pontons and ponton-bridge tracks, mine sweepers, mine layers, coastal patrol boats, all-plywood gliders, transports, training planes, bombers, auxiliary gasoline tanks for planes, laminated wooden arches for large buildings and bridges, outside walls of barracks, butments, and housing projects.

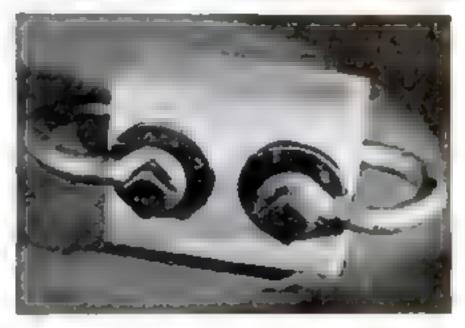

Biggest news in the adhesive industry just now is the creation of phenolic-type resins that will set without heat. This development is of utmost importance because it permits the use of these waterproof glues without access to the equipment found only in large factories. It means that truly waterproof joints can be produced in the smallest factory, by the cabinetmaker, the carpenter, the amateur craftsman. This glue is a liquid

#### NEW GLUES ARE STRONGER THAN THE MATERIALS THEY JOIN

Two clevises were bolted to a seven-ply block of hardwood, as shown below. When the setup was put in a testing machine, it required 1,400 pounds of pull to draw one bolt out of the tough wood fiber

An identical block, drilled the same way, but with iron washers glued on with Cordo-Bond, was subjected to a 4,000-pound pull, but did not give way. Four glue spots added 2,600 pounds' strength

even to the fuel tanks, the Army's AT-10 bomber-pilot trainer is produced by Beechcroft with resin-bonded plywood. Balow, a hotbending press is setting three-ply 3/32-inch mologany into shape for leading edge an airplane wing. Plywood is bonded with urea resin

that will set at room temperature-anywhere from 75 degrees F, upward, but it will set only after the proper catalyst is added. It requires no more than the ordinary degrees of pressure such as can be applied with clamps. This glue is far superior to coldsetting urea resins that have been in wide usage for several years. Not only is it more waterproof, but it requires less critical technique to handle. Cold-setting phenolic glue is manufactured at present by two companies. It is put out under the name Penacolite G 1131 by the Pennsylvania Coal Products Co., Petrolia, Pa., and under the name Cascophen RS 216 by the Casein Company of America. Other research laboratories are at work to the same end, and it is expected that all of the large manufacturers will soon be producing similar adhesives.

The uses for such a remarkable glue are almost limitless. With it you can make outdoor furniture without fear that it will fall apart from heat, humidity, or wetting. Since this chemical achievement, it is a mistake to think of glue as something to be used only indoors. It can be employed in almost any form of construction where gluing is more convenient than other forms of fastening.

Metal-to-metal bonds of surprising

strength are produced from various synthetic resms, and some from a combination of these resins with natural or synthetic rubber cements. By different formulas, metal-towood and other combinations of materials are firmly bonded. Rubber and metals are now joined with bonds so strong that the toughest rubber gives way before the adhesive. Cycleweld is the name given to one of these bonding processes developed by the Chrysler Motors Co. (P.S.M., Aug. '44, p. 126). It is in wide use by some 50 manufacturers in fabricating plane parts and other equipment of many kinds. The Goodyear Tire & Rubber Co., which co-operated with Chrysler in developing the adhesive formu-

las, also produces them under the name of Pilobond. A special development by Goodyear is the bonding of extremely thin veneers of wood to sheet metal. So strongly do the two materials adhere that they are almost as one. The combination sheets can be bent to sharp curves, sheared, stamped, and even welded to other metal. Many uses are possible for such a material, such as house, office, and automobile interiors; panels for planes, trains, busses, and furniture. The strength of metal combined with the rich appearance of fine wood would seem to offer a limitless variety of ways in which it could be employed.

Other adhesives of this type are produced by the U.S. Stoneware Co., under the name of Reanite, (P.S.M., Jan. '44, p. 115); by Consolidated Vultee Aircraft Corporation, under the name of Methond; by the Resinous Products & Chemical Co., under the name of Redux; by Cordo Chemical Co., as Cordo-Bond.

Synthetic-resin glues are turned out as powders, liquids, emulsions, and films. Cold-setting resin powder of the urea type is sold across the counter in hardware and paint stores. It is used by mixing with water. Cold-setting phenolic liquid is expected to be offered to the (Continued on page 218)

Pulling the fuse safety pin on the new 4.5-in, rocket. At right, one man carries the launching tube and projectile in a 50-pound load. Drawing shows the rocket Official U. S. Army Photo

, MIGHTIER THAN THE BAZOOKA, the Army's new 4.5-inch rocket launcher packs all the destructive punch of a 105-mm. howitzer and gives the American infantryman the firepower of heavy artillery. Made of fiber and equipped with sights and a collapsible tripod stand, the new weapon weighs less than 50 pounds with its projectile. The launching tube is easily carried and assembled by one man, who fires the rocket from a safe distance of about 100 feet to one side by means of wires and a battery. Inexpensively made, the launcher is expendable in the field and can be abandoned after firing one round if additional projectiles are not available. Several of the launchers can be grouped as a battery to lay down a terrific barrage.

Navy Corsoir, extra-powered with two rockets, hot-foots it daws the deck of a plane carrier for a take-off Each rocket gives an extra 330 horsepower

EXTRA KICK for Navy planes taking off from carriers, the water, or airfields is obtained by the use of rockets secured to the fuselage Each rocket needles the plane with 330 additional horsepower during the take- if period for a quick getaway. When used on carrier planes, as seen at the left, the rocketa permit a shorter take-off run. This, in turn, allows more aircraft to be massed on the flight deck for speedy attacks-an important cons, teration in carrier work

#### BIG LOAD OF GRIEF

for the enemy has been carried to Allied armies it the front in this "ammo" trailer, which has halted for tire inspection along the road somewhere in France Since nmmunition in large quantities runs to tremendous weights, tankrecovery units, sometimes used for transporting it, must have a sturdy tire equipment. The soltiers shown are examining the rubber on the 34 wheels of the setup

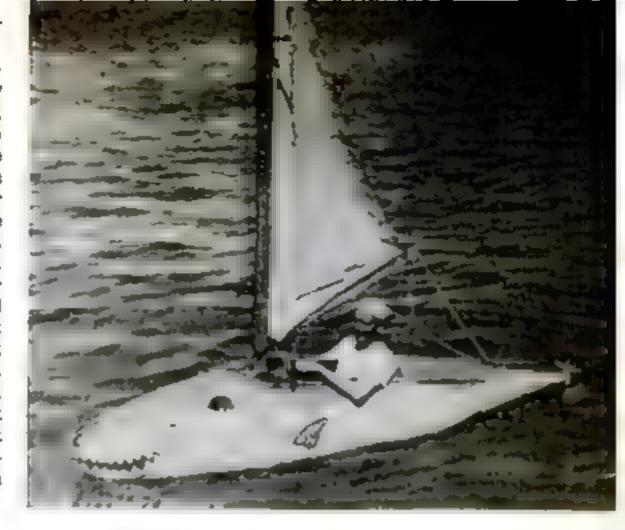

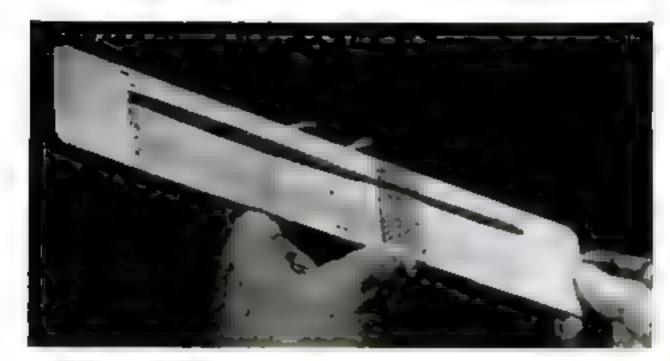

SHAKESPEARE'S LONDON. Constructed for use in the filming of "Henry V." this 70 by 50-foot model of London shows the city as it is believed to have appeared in the late sixteenth and early seventeenth centuries. Most of the buildings represented

here were testroved later by the Great Fire of 1656. The model, which took nearly a year to build, shows the city from the River Thames. The original London Bridge is seen hear the upper right-hand corner, with the Tower above it to the left.

IT'S REALLY A GAS TANK, an auxiliary one that had been jettisoned by an airplane, but Lt. Parker Hatch, commander of the coast patrol ship St. Augustine, found it floating free and adapted it for yachting purposes -with the permission of the Air Forces. A square hole was cut in the tank for a cockpit, and a shallow fin keel with 200 pounds of lead attached. Then Lieutenant Hatch hung a rudder on a hanger made of pipe fittings and eye bolts, painted the hull to represent a contented shark, and christened it "Little Augie." A mast was stepped in, and from this a single jib-headed sail was set. The yacht was 12 feet over all, while the beam was about 31/4 feet. Lieutenant Hatch was subsequently lost when his ship sank in a collision.

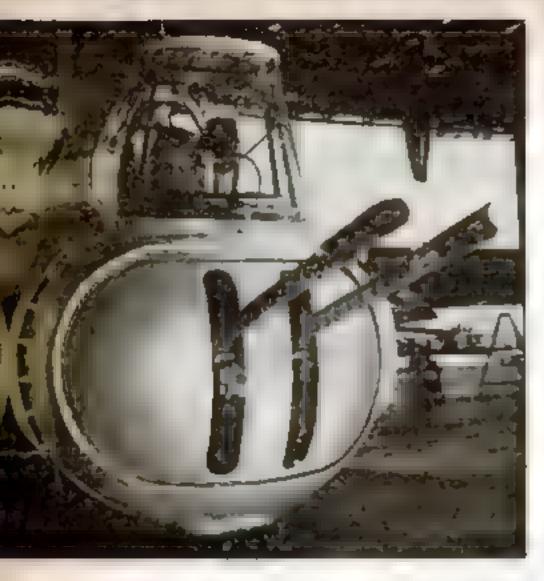

NEW SLIDE RULE, manufactured by Pickett & Eckel, Chicago, simplifies the often complicated process of locating the decimal point in readings. Since the slide rule was invented three centuries ago this problem has been one of the greatest stumbling blocks in its use. The new device will help those who need it to locate the decimal point up to 19 places.

INSIDE STUFF on how the Army's M-4 Sherman tankdozer (below) works is shown in these pictures. The big heavy-shoving blade mounted in front is operated by a hydraulic jack (upper left) powered from inside the tank by a pump driven by the motor. Below (left) is a side view of the forward end of the tankdozer exerting a terrific push on a bank of earth. The steel blade alone weighs about 750 pounds. The tankdozer works under fire.

STING IN THE TAIL and of the Boeing B-17 has been stepped up by this new swivel turret, which allows the twin .50 caliber machine guns to swing through a 90-degree arc, or 30 degrees more than formerly. New turret allows 50 percent more firepower than the old. An all-around flak curtain and bulletproof glass protect the gunner.

PINWHEEL PROP on new MK XIV Spitfire was developed to handle full 2,000 horsepower supplied by the latest Rolls Royce Griffon 65 engine. For the first time, a fivebladed propeller is used in modern aircraft. Combined with increased power, the prop makes this model even better than Spitfire MK-IX, which itself was good for more than 400 miles an hour

SHOCK WAVES of compressibility around the engine in high-speed dives are combatted by the airflow-decelerator flaps under the wings of the Lockheed P-38 fighter. Without these, the air around this part of the plane reaches supersonic speed in such dives. The resulting shock waves meet the tall surfaces, and vibration and shock result. These flaps slow the airflow to below the point of compressibility-formed abook waves, thereby saving the tails from buffeting and making the tail control surfaces effective even with the aircraft flying at unprecedented speeds.

THE DC-6 TRANSPORT, a commercial development of the famed Douglas C-54 troop carrier, has been ordered in large numbers by leading air lines for postwar use. Four 2,100-hp. Pratt & Whitney Double Wasps will pull the ship at 300 m.p.h.—enough to speed it across the continent in eight and a half hours, or from New York to Chicago in less than three. A cut-away drawing of the giant liner is seen at the right, and at lower right a conception of the ship in flight. Maximum cruising range will be 3,540 miles. A pressurized cabin and better sound-proofing will be included

TWO JET PLANES, one the Bell P-59A Alracomet. first ship of this type to be developed in this country the other, the British Gloucester, are being powered by Whittle jet engines. Twin propulsion units, one under each wing and close to the fuselage, distinguish the American plane (above) from the British, which has but one unit, internally and centrally mounted. The Gloucester (below), because of its unusual maneuverability and tremendous speed, found good hunting in whipping after the Nazi s V-1 robot bombs and basting them out of the sky before they landed. There is as yet no report of the Airacomet having been used in combat. Both planes operate on the same principle: air is drawn in at the front end of the unit, compressed, augmented with burning fuel, and then discharged out the back end to produce the necessary thrust for flight. In addition to its speed, the Airacomet is also said to have a high ceiling. Performance figures and construction specifications of both fighters are, as yet, military

At home on land and in water, slimy ooze, or snow, the Water Weasel, one of our hitherto secret military vehicles, carries three men besides the driver, or as much as 1,200 pounds of cargo. Speeds range from about four miles an hour in water to as much as 30 on land. For maneuverability it has six speeds forward and two reverse, There's a watertight tank on each end

Photographs by WILLIAM W. MORRIS

## The Weasel Goes Anywhere...

Over lakes and across rivers, through swamps or snow, and up or down slopes no vehicle could ever negotiate before.

With its six-cylinder engine, the Weasel ploughs through heavy underbrush, pushing down shrubs and small trees. Winch is for hauling up steepest banks

Caterpillar tracks serve as propellers through the water, and two rudders steer the aquatic vehicle from a tiller bar in front. As a boat it has only 10 inches of freeboard

the M-29c cargo carrier, alias the Water Weasel. It goes places where no other vehicle can. Mud, slime, swamps, and lakes are its meat. It can crawl up an almost perpendicular slope, dive into a pond, swim across, and creep out again. It travels over soft snow where a man would sink up to his waist.

The amphibious Wessel is a refinement on the M-29 cargo carrier (P.S.M., Sept. '44, p. 71), which has been in action against the Japs in the Aleutians, and against the Italians and the Germans on the other fronts. The seagoing version helped us mightily in

POPULAR SCIENCE

getting through terrain flooded by the Nazis in Normandy and Holland.

Weighing only 4,700 pounds, the Weasel crawls on two tracks of 20-inch width. It is 60 inches wide. itself, so two thirds of its bottom surface is in contact with the ground. This gives it traction unequaled by any other vehicle, a ground pressure of only 1.91 pounds per square inch with a cargo of 1,200 pounds. This is why it. can travel over powder snow where a man would sink, for a man exerts a ground pressure of four to ñve pounds per aquare inch through his feet. The Weasel's broad tracks give it a total ground contact of 3,121 square inches. A 21/2ton truck, through its 10 tires, has only 560 square inches of road contact: . B jeep, with its four tires. about 140.

The Weasel has gone through several stages of evolution since the first model was built in the aummer of 1942 by the Studebaker Corporation to specifications of the Ordnance Department. First, it was designed as a snow buggy to be used against the Japa in the Aleutian Islands; it carried two men and was not amphibious, but it proved itself in short order. The next step was to add watertight tanks, front and rear; now it could swim, using only its tracks for propellers. Steering in water by means of the tracks was found difficult, so the Water Weasel was given two rudders and a simple steering system through small cables.

In water, the M-29c makes about four miles an hour On land it can do as much as 30. It can climb onto a 2½-ton truck under its own power if the truck is backed up to a bank or mound about three feet high. In this way the Weasel is carried rapidly over highways to climb down again and go

No dammed lake can stop the Water Weasel. Here it is shown at the climax of its climb over the dam. The angle shown is moderate, for the Weasel can crawl up an almost perpendicular slope

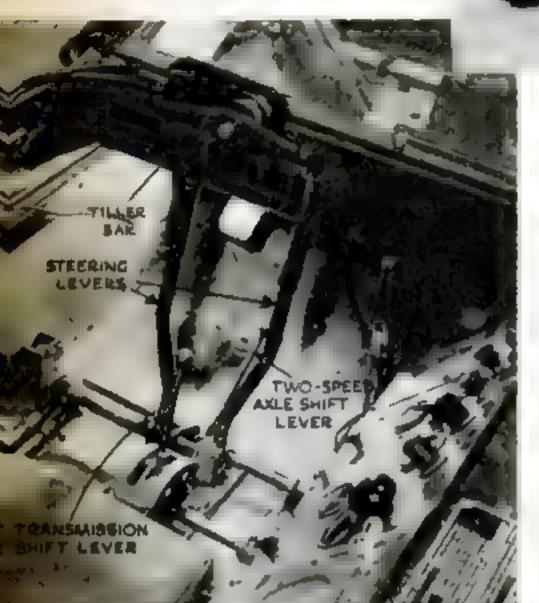

Having arrived at the top of the dam, the Weasel comes to a full stop. To plunge into the water too rapidly might swamp the amphibian, and so the driver, relying on the tracks as brakes, prepares to . . .

... ease the water-going truck gently down the steep bank into the lake. The budyancy of the front watertight tank keeps it from diving, but it goes under the water about 2½ feet on the descent, then levels

Controls are so simple that the Weasel can be driven with reins like a horse. This stunt, demonstrated at right with the land-version M-29, is a lifesover in crossing crevasses covered by snow

To tractor or truck drivers, the Weasel contrals offer no great problems, Land steering is accomplished with the two levers shown belaw (center); the tiller above moves rudders

ahead when the truck can no longer proceed.

The Weasel can pull itself out of a lake

if the bank is just a little less than perpendicular so that it can get a toe hold. If the banks are all too steep, it can still get out by using its motor-driven capstan

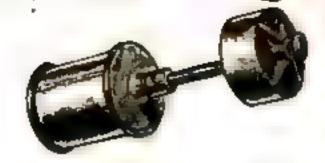

To do all the remarkable things it does, you would think the Weasel must have a terrific power plant. Actually it has nothing more, or less, than a standard Studebaker Champion motor, but it has a two-range axle which gives it six speeds forward and two reverse. In the lowest gears, the motor turns at extremely high speed and takes a lot of punishment, but these gears are used only in the toughest going. In water, the highest gears are used, and the two tracks throw up a double wake in the rear. There are four sets of four bogey wheels on each side, each set attached to a transverse elliptical spring. The tracks are driven by sprocket wheels in the rear. They are semiflexible, made of light-gauge steel padded with rubber.-GoLD V. SANDERS

How the rudders are lowered before the Weasel is put into the water. Variation of caterpillar-track speeds, effective on land, is not sufficient for water maneuvers, though tracks act as propellers

Rudders high in the air, the Weasel heads down the steep bank into the lake. Driver steers across the water by means of a simple cable-operated system

This British brute, called the AVRE, is a mortar-equipped tank designed for enemy wall cracking. It hards a projectile (obove), known as "the flying dustbin," which holds an explosive charge many times the weight of that in any other similar-sized projectile

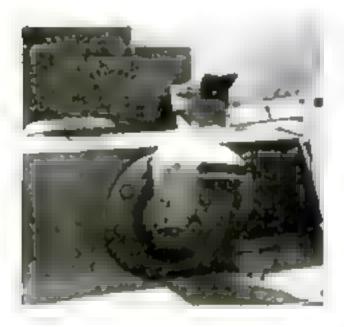

Fired from tank martar (above), "the flying dustbin" had this effect on a concrete walt. It destroys concrete 10 feet high and 10 feet thick

BLASTING AND SEARING THE ENEMY are the purposes of the British mortar tank and tank fiame throwers seen on this page. The AVRE, shown directly above, gets its name from Armored Vehicle (Royal Engineers). The mortar mounted in the turret, known familiarly as the "petard," hurls a devastating charge of explosive, as may be seen in the photograph at left. The British term for the projectile, "flying dustbin," is explained by the fact that "dustbin" is

The "Crocodile" and "Wasp" flame throwers shown below are armored blowtorches that can be carried forward under fire to attack enemy strong points. The former is effective at ranges up to 150 yards or more. American tanks are now also equipped with similar weapons.

Most effective flame thrower in British army is the "Crocodile" litted to a Churchill tank. At left, the projector muzzie in the tank's nose is shown; below, flame spurting 150 yards. Special new-type fuel is towed by the tank in a large armored trailer

British for "ash can."

Another British fire demon is the "Wasp," a harnlike projector fitted to an armored carrier. Here it is shown in action (below) and close up for a view of projector

TELEVISION window displays, in a modernized plan, avert sidewalk jams created by pioneer attempts. In an arcade recessed from the building line, viewers watch shop exhibits without obstructing the passers-by.

Images on the viewing screens are automatically brightened or dimmed by a photo cell which responds to changes in outdoor light; and another control regulates sound volume to be comfortably audible above street noises, but not loud enough to be objectionable outside. Merchandise is attractively arranged about the 18 by 24-inch screens, which may eventually be enlarged to three by four feet or more.

with the armed services, speed and simplify the work of weather men attached to fast-moving units. Transparent cylinders of shatterproof plastic replace the copper tubes of standard instruments, and readings may be taken at a glance by sighting at a graduated scale, as shown at left. In the conventional type, measurements of precipitation are made by inserting a graduated rod into the copper cylinder

Compact in size, the new rain meter fits its purpose as well as the bulkier installations employed at permanent weather stations, which its resembles in principle. A funnel four inches in diameter collects rain in a small inner tube, thus multiplying the reading for precision. Overflow, draining into the outer tube, is poured back for measurement. The plastic scale is declared to serve with satisfactory precision in tropical

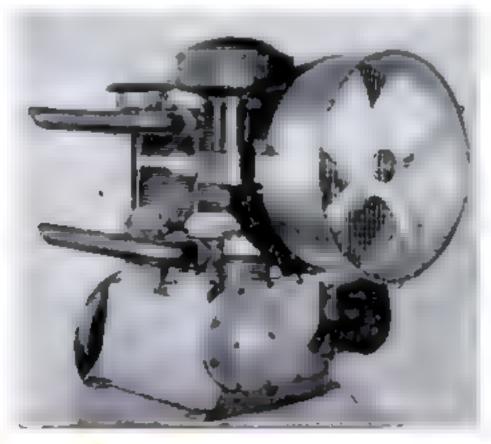

heat or Arctic cold,

concrete "cartribges," stronger and cheaper than steel and lighter than aluminum, promise a new structural material for buildings and dams. Compacted by vibration while damp, the concrete is piston-packed into thin metal shells surrounded by spirals of steel wire, which it puts under permanent tension, in the Northwestern University process. Mass production of columns, like the one at right shown under test,

would conserve U.S. Iron ore.

two cylinders develop as much as 32 horsepower in this compact auxiliary engine for land, sea, and air. Burning gasoline, the power plant employs the double-acting principle in which floating pistons receive power impulses at both ends of a stroke. The cooling problem, called the bugaboo of engines of this type, has been solved by placing heat-absorbing fins on the inside of the hollow pistons and circulating carburetor-intake air about them. Proposed uses include starting engines for larger plants and powering firefighting installations.

AN "ASTROPHANE," a device so named by its New York designer, Otto J. Russert, is a three-in-one instrument for schools and museums that combines a celestial globe, a miniature planetarium, and a training device for navigators of ships and planes. Stars of the first to fifth magnitudes, inclusive, appear in their proper places on the 16-inch glass globe. Turning a knob, as shown, revolves models of planets within the sphere to their configuration at any past or future date.

# The Boy Who Built a Helicopter

..., and now Stanley Hiller is working for Henry Kaiser as a designer of postwar aircraft.

A 19-YEAR-OLD engineer, largely selftaught, has produced what may prove to be one of the world's best helicopters.

Lean, black-haired Stanley Hiller, Jr., of Berkeley, Calif., who headed a \$100,000-ayear business in model automobiles by the time he was 14 years old, is the designer of the machine. He calls it a "Hiller-copter."

It must be pretty good. The other day, one of America's leading industrialists, Henry J. Kaiser, the shipbuilding man, bought the manufacturing rights to it and "took over" young Hiller. The youngster was instructed to design other "Hiller-copters" for Kaiser Cargo, Inc., which is no mere side dish on the Kaiser menu.

Young as he is, Stanley Hitler is traveling in fast engineering company. He is a natural in mechanics. At 12 he was manufacturing model racing cars in the family

Stanley Hiller, Jr., at the controls of his "Hiller-copter." Note "clean" instrument ponel.

basement. At 14, expanding his model-car business to achieve assembly-line production, he was toying with helicopter flight. At 17 he demonstrated to the Army the mechanism that, he said, would make his helicopter work.

Helicopters began to intrigue him because of what he considered their mechanical imperfection. This "Henry Ford of the Midgets," as he is known for his manufacture of tiny cars fitted with fractional-horsepower gasoline engines, was puzzled because al-

Towing through city streets and along country roads presents no problem: ship is narrow and its rators can be aligned along the horizontal axis. Airfail section of each rotor blade is 10 feet long, 14 inches wide

NO HANDS! To demonstrate the craft's stability, the 19-year-old inventor lets go of the controls as the helicopter hovers in midair in a California stadium. Only flight controls are stick, rudder, and pitch lever

most all the designers of currently successful helicopters put a small propeller on the back ends of their machines.

Whirling in a vertical plane, it compensated for torque—the reaction set up by the canopy of blades overhead that impelled the fuselage to turn in the opposite direction. That wasted power, he reasoned.

So he began experimenting with two sets of blades, one above the other and turning in opposite directions. That would damp out the torque of that collection of lifting blades, called the rotor. It was Hiller's first

fling at aeronautics. Characteristically, his friends say, he tackled one of the oldest and horniest of flying's problems. Men have grown gray trying to evolve a formula for rotating-wing

flight.

His idea wasn't new. By count.-Hiller is nothing if not thorough—he found that 37 inventors before him had built helicopters with two rotors mounted in that fashion. They were called coaxial rotors. But almost all of these machines were dismally unsuccessful. Hiller set out to find out why.

His equipment in formal education was something less than formidable. He had been to a college-preparatory school at Milford, Conn. -employing his time out of the classroom to pore through semi-technical magazines. It was here that he began studying hellcopter flight. Back home his father and a plant manager kept his embryo model racing-car business going. Within a few months after returning to Berkeley in mid-1940, the boy was fabricating the cars at a rate of -250 a month.

Except for such items as spark plugs and magnetos, he manufactured the machines

By having two to the ordinory helicopter's one, the ship gets enough lift from rotors that have a span of only 24 feet. As indicated by this thren-view drawing, this lets the ship land and take off from the proverbial dime. Rotors are 16 inches opart, with relative positions similar to that of wings of a standard biplane 24-01 5-0"

complete, including a single-cylinder engine that kicked up one horsepower when it was pushed to 18,000 r.p.m. To young Hiller, designing and building that engine was a major job. To insure long wear, he cast the crankcase and differential as a single unit. He made the die, then designed a machine to run the die. This led to the development of another machine, to make strong aluminum-siloy castings by die-forging them. His castings were nearly as strong as steel and two thirds lighter.

He obtained a patent on that.

Nights and week ends he kept sketching belicopters.

Having demonstrated his business acumen, he elected to study engineering at the University of California. But helicopters kept plaguing him, and at the end of his freshman year he left the campus to do research work.

He needed space for free-flight experiments. So he set up a laboratory near his father's shipping company on the ninth floor of a San Francisco office building. There he experimented both with wing shapes and with a mechanism that would permit him to control the angle of the rotor blades in flight. It was a rare day when workers in adjoining offices didn't see one of Hiller's model helicopters drifting down the side of the building.

Again he exhibited his gift for scientific thoroughness. The performance of those models was photographed with both movie and still cameras.

It was a year before Hiller finally nodded his head to the draftsman who was helping him. He was satisfied with his wing shape (or airfoil section), with the mechanism intended to control the angle at which the blades attacked the air, and with the spacing between the upper and lower sets of blades.

The control mechanism was the heart of the matter. He knew that. So he built one to half scale and set off for the Army Air Forces Materiel Command laboratories at Wright Field, Dayton, Ohio.

Young Mr. Hiller was now all of 17 years old.

At Dayton he explained how his machine worked. He wanted suggestions. Just as important, he wanted help on priorities for a light sircraft engine to power his machine. The Army officers pursed their lips and rubbed their chins. Nope, they said, it wouldn't fly. The swept-disk area of the blades (the area covered by the blades in rotation) wasn't big enough.

"Those officers," he relates somewhat wistfully, "thought my machine would not fly."

That didn't stop him. He put the wraps

back on his device and caught an airliner straight to Washington. There he button-holed A. W. Lewis, head of the aircraft priorities branch of the War Production Board. He went to Grover Loening, aircraft consultant to the WPB and chairman of the rotary-wing division of the National Advisory Committee for Aeronautics.

He got what he wanted.

On a summy afternoon last May the Hiller-copter made its maiden flight from the concrete driveway of his home. It wasn't a long flight. For safety's sake, Hiller had tethered the machine to the bumper of his automobile. The 'copter inched off the driveway, hovered, and settled back. Another hour of testing—with the machine still restrained by a cable—followed.

Now Hiller was ready for the big moment. Up to now he had never even seen a helicopter in free flight. Secretly he trundied his machine into the University of California's football stadium. There he climbed aboard, started the engine, and manipulated the controls.

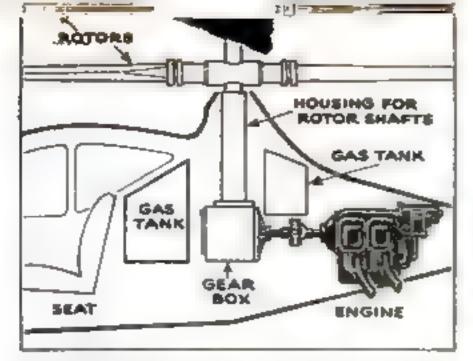

The Hiller-copter, unfettered, was a perfect lady. It climbed, turned, and gently came to rest on its tricycle landing gear at the will of the man in the cockpit.

Since that day it has put in a good many hours searing over the stadium and the low hills near by. Hiller in one instance made a take-off from a San Francisco street. At no time has it been higher than 100 feet, but that's sufficient to prove that it can fly above the area of "ground effect," where air pushed earthward by the rotors buoys up a ship on the rebound. Sometimes helicopters will fly with benefit of ground effect, but no higher.

Ostensibly the Hiller-copter has departed no great distance from conventional rotating-wing aircraft with rotors of coaxial design. There have been other machines with coaxial rotors that were more or less successful. (P.S.M., June '44, p. 57) The Hiller-copter carries a 90-hp. Franklin aircooled engine, set aft to counterbalance the pilot's weight. It has a top speed of about 90 m.p.h. and has flown for as long as an hour and a half at a time.

A successful coaxial-rotored helicopter is something of a rarity because its design poses stupendous engineering problems. The more familiar helicopters have either balanced rotors set on outriggers to either side of the fuselage, or a single, big main rotor offset for torque by an auxiliary rotor on the tail. The prewar Focke-Achgelis machine is an example of the former and the near-famous Sikorsky VS-300 of the latter.

The Hiller-copter's two rotors, set 16 inches apart, revolve at 240 r p.m. and describe a circle 24 feet in diameter. Each

Schematic drawing of the "heart" of the ship. The 90-hp. engine spins the rotors at an almost constant r.p.m. of 240, to produce speeds (controlled by blade pitch) up to 90 m.p.h. At right, Hiller inspects engine, which is mounted in the tail instead of under rotor most, as in more familiar 'copters

rotor blads—there are two in each set—has an airfoil section 10 feet long and a uniform chord (an imaginary line drawn from the leading to the trailing edge) of 14 inches. Hitler estimates his total lifting surface at 46 66 square feet

As in some other helicopters, the blades can be feathered individually or as units for lateral, directional, and longitudinal control. In addition Hiller can vary the pitch of the blades in one rotor without affecting those in the other rotor.

Ascent and descent are achieved by varying rotor pitch and engine speed. Horizontal flight depends on increasing the pitch of each blade as it wheels through one segment of its circle, and decreasing the pitch as it reaches the opposite segment.

Hiller's control Mechanism design is secret.

What distinguishes the Hiller-copter from

other coaxial machines, according to those who have seen it fly, are a lack of vibration and the case with which it can be flown.

The XC-30033, as Hiller calls it, is purely an experimental machine of fabric-covered steel tubing. From the front the fuselage resembles the shout of a sea elephant. The cabin is enclosed, above shoulder height, with transparent plastic, giving vision all ways except straight down.

Hiller has two new designs on his drawing board. One is a two-passenger ship for carting persons and baggage short distances from air-line terminals. The other, bigger, is intended to cruise for hundreds of miles and, if necessary, to do emergency work at sea. It can be fitted with three stretchers.

The young inventor reads voraciously. Included in his library is a complete file of POPULAR SCIENCE MONTHLY since 1928.—ANDREW R. BOONE.

Hiller broke into engineering at 12 by making gas-driven racing-car models. At 14 he had an assembly-line plant (above) that was doing a \$100,000-a-year business. At 17 he had developed the Hiller-copter. Now, at 19, both he and his remarkable ship have been "taken over" by Henry J. Kaiser as a "subsidiary"

# The B-29 Brings

## A New Era In Bombing

An Intelligence officer of the global Twentieth Air Force tells how "engineered flight" makes the big Boeing bombers one of Tokyo's main headaches.

> By MAJ. SELBY W. CALKINS As told to DEVON FRANCIS

/E WERE sweating. We knew that 1,500 miles away a task force of B-29 bombers was—or ought to be—pounding Japan.

For months we had been saying that the Superfortresses would reach their target at a moment that could be predetermined right there at the Twentieth Bomber Command operations office in interior China. That was how the B-29 had been built. That was the operational technique that we were using on this first raid on the Japanese homeland.

But now, as we sat in a shack with blacked-out windows in that hot, humid China night, the time had come—and the squawk box connected with Radio was mute. I glanced at my wrist watch to make sure. It was 11:55 p.m., China time.

Waiting with us were Maj, Gen, George E. Stratemeyer, commanding the Army Air Forces in the India-Burma sector, and, of course, Brig. Gen. K. B. Wolfe, commanding general of the Twentieth. Flanking them were the high-ranking officers of their staffs.

For hours we had been plotting the assumed progress of the bombers, maintaining strict radio silence, toward their target, the Yawata steel works on the island of Kyushu. Inside the bamboo-and-mud structure that served both as an air room and, during a raid, as an operations office, we had tacked maps on the pine-sheathed walls. On those

AS HEAD of the A-2 (Intelligence) Section in China for the Twensieth Bomber Command, Major Calkins participated in two Boeing Superfortress raids. In the first strike at Anchan, the code word for "Bombs Away" in the bombardment group with which he rode was "Indy," the name of one of

Maj. Selby W. Calkins

his small daughters. Judy is a fiver herself, having piled up 250 hours in the air with ber tather before the was three.

The olders emerging form being in Cries which early completed recountry. The Japan were first up the range of southents, and incomintel presents from the populations. meteor is based on preliminary

HISTORIC DOCUMENT. This terms announcement, Twentieth Air Force Communique No. 1, told the world that the B-29 had tasted blood in its first actual raid

FIREPOWER of the Superfortress is the bane of the Jap interceptor fleets. Repeatedly N p fighters have swarmed in upon one or more 8-29's, only to discover that it was a short cut to hara-kiri. The any compaint you have from the Superfortress gunners is over the scarcity of targets. In the drawing above PS.M. artist Frank Ties by has graphically liustrated the terrific gun punch packed by the big bombers.

FORTRESS AND SUPERFORTRESS Below is a comparison of the 8.29 with its the (but older) brother the Boeing 8.17 Fiying Fortress. The plane at lower right is a Superfortress, the two others 8.17 s. A little study in perspective will show the comparative size. The nearer 8.17 is much a other to the camera than the 8.29. Note the latter's longer nose and relatively narrow chord of its wing

maps we were continually marking crosses.

"They're here now," we would say. According to our calculations, that was where the bombers had to be,

They had to be there, because the B-29's were being flown by slide rule. We were introducing engineered flight to air warfare. There was to be no throttle-pushing in our operations. The man who had done the estimating on target time was Burton H. Burns, a Texan. Now a lieutenant colonel. Burns had won so many decorations flying in the Southwest Pacific that after he got to China the "fruit salad" for his blouse was still catching up with him.

I glanced at Burns' pink face. He looked unconcerned. Burns came by his poker face naturally. He departed the Southwest Pacific with \$3,000 that he had made by filling inside straights, and once in Honolulu he won his commanding officer's automobile in

a crap game.

His admiration for the Japa was on the faint side. "They've got tails," he would say. "The lead plane will break radio silence," Burns had forecast, "at 23:55." That was 11:55 China time.

But it was target time now.

"Shouldn't we be hearing?" asked General Wolfe. The question was rhetorical.

I strolled over to the map and started drawing a picture of a bomb over the target. Nobody was saying anything. It took me a long time to draw the picture. I meant it to.

Suddenly the squawk box came to life "Radio to A-2," it blatted. Nobody breathed. "Bombs away signal at 23:58."

We were three minutes off our estimate.

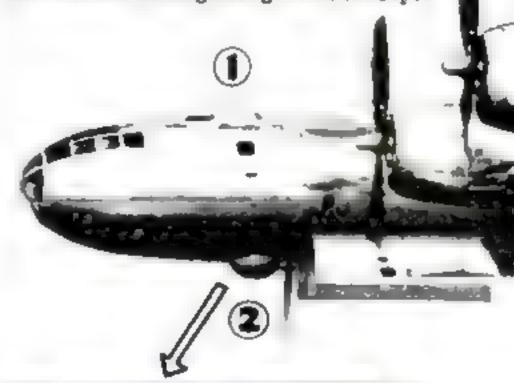

Engineered flight would work. We had proved it. Subsequent raids added to the evidence,

It worked because the B-29 Boeing Superfortress is an airborne battleship in miniature. The Army describes its raids as "task force" strikes. At his spacious deak sits the flight engineer, one member of the 11-man crew. He knows, and the pilot and

copilot know, that they are handling an intricate mechanism. A balance must be struck between the loaded weight of the airplane and the speed at which it is operated to obtain maximum flying range. On his curve of power output the engineer selects the manifold pressure and engine revolutions to obtain the highest "permissible brake mean effective pressure" inside the cylinders. He makes that selection not once but dozens of times during the course of a flight as fuel is consumed and the bombs are dropped and the weight of the airplane lessens.

Between the pilot and the engineer runs a constant interchange of information on the intercom. What is the present center of gravity, the proper cruising speed? Perhaps the cowl flaps, governing the flow of air around the four 2,200-horsepower Wright Cyclone engines, need adjustment to reduce the cylinder-head temperatures. At any given moment the engineer can tell the men on the "front porch" the exact fuel consumption of each of the engines in pounds per hour.

He controls the settings for mixing fuel and air. He starts an auxiliary gasoline engine to provide added electrical energy for take-offs and landings. He governs the super-

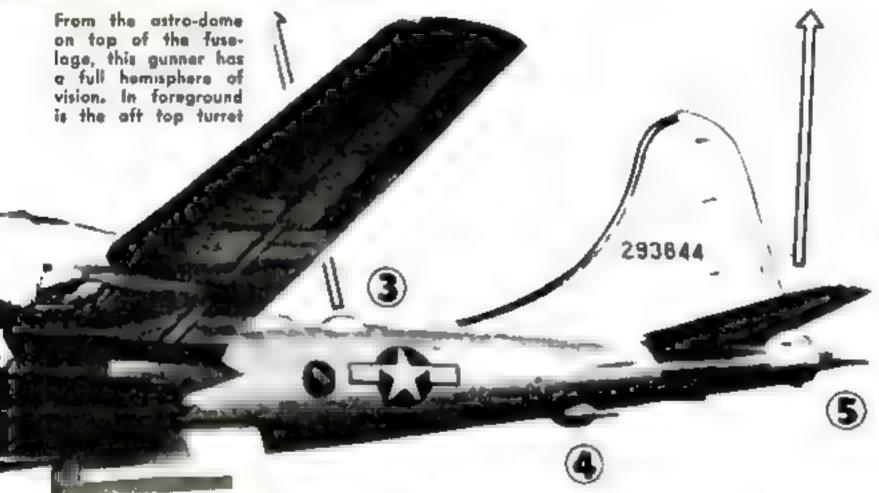

Here you are looking through a tunnel formed by the opened doors of the two bomb boys of the 8-29. The two .50 caliber machine guns seen in the forward belly turret are remotely controlled like those in the four other positions indicated on the large photograph above

"Tail-end Charlie" is always the last man home. In his "office" under the rudder he controls the two .50 caliber machine guns and one 20-mm, cannon that make this one of the best-protected spots on a B-29

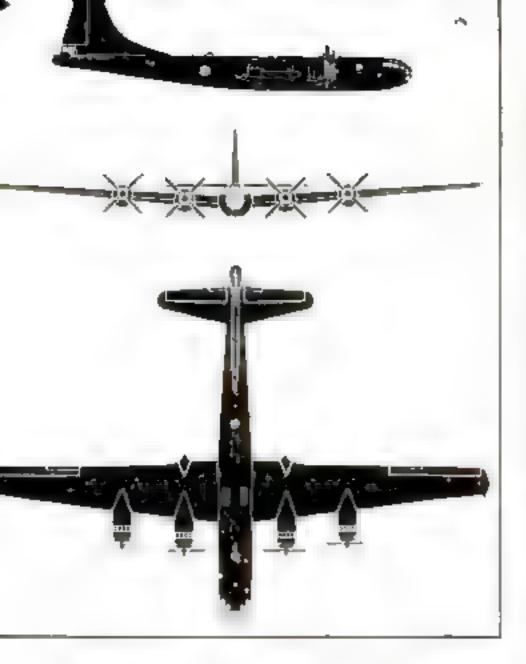

GUNS, GUNS. This officially approved picture discloses for the first time the locations of the remotely controlled multiple-gun stations on the Superfortress. The B-29 is not the most heavily armed of Aliced bombers; some others, toting more and bigger guns, are employed literally as flying artillery on tactical missions. The Superfortress IS the best gunned of all the strategic bombers

charging of the fuselage interior so that the crew can work at a simulated altitude of 8,000 to 8,500 feet while flying at 30,000 or above.

More engineering has gone into the B-29's two bomb bays than ever before went into the belly of an airplane. In them are stored anything from block-busters to 25-pound incendiary clusters. The B-29 can carry these missiles in whole or in combination. The bombardier can play on his shackle releases as a musician plays on the keys of an organ. Under normal conditions the bomb load is double what the B-17 Flying Fortress

can carry by filling its bays and hanging bombs from the wings for short-range operation.

In terms of crew efficiency, supercharging the fuselage finally has rendered high-altitude bombing as precise as a laboratory study. Crews of the bombers that blasted away at Germany for almost four years prior to the invasion often came home with fingers, faces or toes frozen. The interior of the B-29 is so warm and comfortable that crewmen seldom have to don even as much as a leather flying jacket. More than one pilot, sitting in the "greenhouse" in

KNOW THE B-29. This three-view drawing shows the family resemblance to the Bosing 5-17, which was originally designed almost a decade ago

the sun, has shed his shirt to keep cool while the outside thermometer registered well below freezing.

Just as the B-29 was engineered for sliderule flight, so was it designed for slide-rule combat. An evaluation of the airplane as a superb means of transportation for explosives and as a weapon to sluice those explosives accurately onto a target must be back-dropped by a description of the job it was built for.

The Superfortress is a strategic bomber. It is being used on Japan in the same fashion that the Flying Fortresses, Lancasters, and B-24's were used on Hitler's Europe. The swift march of Allied soldiers into Germany was accelerated by the smashing of Nazi oil-producing centers and of factories making machine tools, ball bearings, synthetic rubber and fuel, and railroad rolling stock.

In East Asia the task is far bigger. The

distances are more than twice as great. Japan's economic empire is far richer. In Europe, Axis industry was within Allied bombing range from the beginning. In Asia we are only now getting within range to erode the sources of Japan's industrial ability to make war.

We are within range only because the B-29 was built with twice the radius of action of the B-17. The Japs say we are basing the Twentieth at Chengtu, Szechwan province. If that is true, we are flying round-trip missions of 3,000 miles in atriking at Nagasaki; we are flying 2,600 miles to hit Anchan, Manchuria. A known yard-atick of the Superfortress' range is the round-trip distance from India to eastern Sumatra—more than 3,600 miles. Planes based with the Southeast Asia Command atruck the Pladjoe refinery at Palembang. Sumatra, the enemy's largest source of oil, on August 10.

And the B-29 can fly farther than that.

As a weapon, the airplane is largely selfcontained. It employs its own operational
techniques.

After one raid the Jap radio commented: "Each man (pilot) flew in a direction to his own liking, at his own convenient altitude, and when the enemy planes withdrew it was done according to each man's fancy."

That was correct. Above their base after take-off the B-29's made rendezvous in elements of four. In elements of four they flew to their target. To bunch them in squadrons of 18 to 27 like the B-17's, to require large numbers of the ships to keep jockeying for places in a formation, would cost fuel. Sometimes, as in any other bombing operation, planes have to turn back short of their target. Sometimes planes have to go into the attack singly

But I have yet to run across a Superfortress crew that is apprehensive over the loss of supporting fire from other planes in its element. The men of the B-29's know they can throw enough lead for their own defense. The system of fire control insures that.

There is no point on the airplane that an enemy fighter could attack without flying into the muzzles of at least two .50 caliber guns, and in the course of his attack he will run into multiples (Continued on page 222)

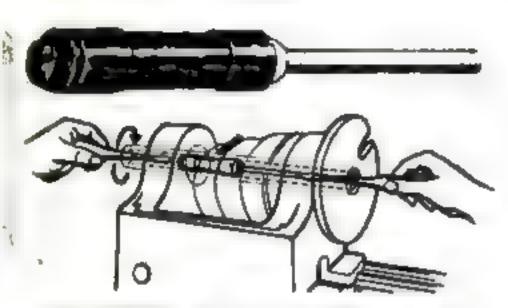

### BOEING B-29 SUPERFORTRESS.

Here Jo Kotula's brush has captured the sleek lines of the Superfortress, the weapon of our global Twentieth Air Force. Note the perfectly round fuselage, designed for high-altitude supercharging. Fairings of inboard engine nacelles stick out beyond trailing edge of wing. The 8-29 is 98 feet long, has a wing spread of 141.2 feet. Four 2,200-hp. Wright Cyclone engines drive the grant

TO SHIELD THE CHUCK of the lightweight pneumatic drill made by Ingersoll-Rand Co., New York, a collar has been designed to protect the user's hand while enabling him to guide the drill easily and accurately. The whole outfit weighs only two pounds, but is sturdily built for three-shift endurance.

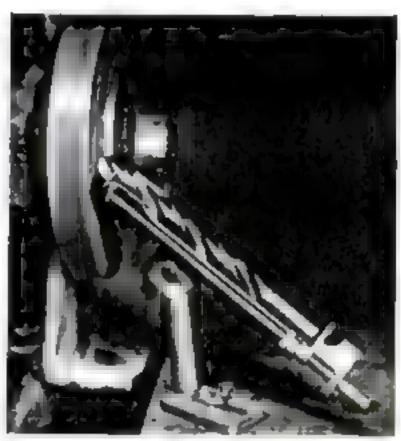

EXPANDING COLLET ACTION locks this stop in the hollow spindle of a lathe for locating repeat work. The Rieger Spindle Stop is set by two screwdrivers. It has a fe by 4-inch extension to limit hollow work and to protrude into the chuck for stopping short pieces.

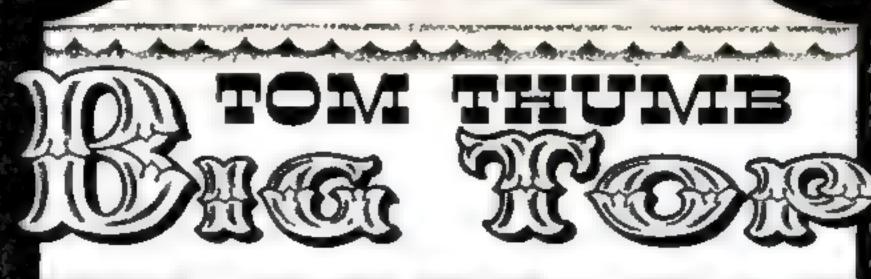

RECOIL PRESSURE of springs up to seven inches long is measured by this new coil spring tester and torque wrench made by the New Britain Machine Co., New Britain, Conn.

SHARPEN THAT DRILL, Here is an inexpensive new drill-grinding attachment, made by the Crandall Manufacturing Co., Los Angeles, Calif., that holds long, short, and medium twist drills from A to 1 inches in diameter.

ELECTRICAL MAGNIFICATION on ables the new DoAll comparator to accomplish what formerly required four instruments. Three models made by Continental Machines, Inc., measure variations from four one-thousandths to 400 one-millionths of an inch.

HOW MODEL MAKERS BUILD THEIR OWN AMAZINGLY REALISTIC LITTLE REPLICAS OF CIRCUS WAGONS, TENTS, AND SIDE SHOWS

By JEAN ACKERMANN

VERYTHING about the circus except that heady, nose-wrinkling aroma is faithfully reproduced in miniature by members of the Circus Model Builders and Owners Association. This organization is a group of craftsmen who are young-hearted enough to thrill to the lure of lions 'n tigers 'n everything, and sufficiently skilled to dramatize their interest in the table-top circuses they are building. They may be farmers, mili hands, schoolboys, or business men. The hobby is highly specialized, so there are few blueprints available, and the fans have to go after their own data. When the circus comes to town, any conscientious modeler gets up before dawn and goes out to greet the troupe, lends a hand with the properties, and spends a day of sheer glory, measuring wheel spokes and elephants' trunks, and reveling in the backstage talk

Table-top circus modeling has already attracted 200 craftsmen, aged 16 to 75, from 28 states. All are members of the national association, which has its headquarters in Harrisburg, Pa. Organized in 1936, the association encourages intermember correspondence, sponsors exhibits, and issues membership cards that give the modelers access to the back-tent area of any show. Profeszional circus people welcome the modeler and give him valuable aid, while he in turn helps them slice through local red taps when the show visits his town.

Many modelers prefer to concentrate on animal and property wagons, which are more tricky to build than tents and side shows. Others have developed complete shows of their own, with impressive names such as "Wagner's Miniature Circus, Win-

This authentic model of a three-section den was copied from a wagen used by the Hagenbeck-Wallace Circus

power plant on this page, the illustrations here are all of the Wagner circus, owned by H Russell Wagner, secretary-treasurer of the association.

Each modeler has his own favorite woods and methods of construc-

wa the proctical and oseic parts of a cir-. a are reproduced in odels. This is the mooo power plent that i nnaratas electric curtat for the Roadlights

"Lodenz an gent's ment Step right up and sen this unperatlated and unprocedented aggragation of strange people from all over areation." This model side show is a triumph of make-ballove

tion. Some like white pine for the wagons and others use brick-cheese boxes (yellow pine). Adornment of vans is a challenging problem. When brilliant paint isn't sumcient decoration, modelers often raid their wives' lewel boxes to unearth gay brooches. earrings, and other trinkets, which they glue onto their vans.

In spite of their love for gimcracks, the builders value realism above prettiness. A modeler hates an eye-catching wagon that shows flaky paint and rough edges. And band wagons, the public's favorites, are no more alluring to the good workman than the cooking and generator vans that do a show's dirty work.

Each wagon has its own team, four to six horses, depending on the load. While the modelers make the wagon bodies by hand, those unskilled in wood carving buy readymade horses and paint on harness. The horses are then hitched to the doubletree that links them to the wagon proper. Reins are heavy buttonhole thread, which the driver "holds" through a hole drilled beneath his arms. The effect is very realistic.

Wagner's three-ring setup is beautifully detailed. Arranged on a huge table in his basement workshop, the little big show, scaled A" to the foot, is complete even to its own railroad rolling stock, into which the whole circus fits. A hobo lying beside the miniature tracks adds a touch of realism.

Circling the table is a parade of animal dens. First on the Midway, carefully placed for the sucker trade, is the side-show tent, Behind it are the menagerie and the big top. Back-yard tents, generally unnoticed by the public, are those for dressing, dining, blacksmithing, and truck shelter. These, along with the property, animal, and power wagons, and several bulldozers, fit into eight flatcars, four or more wagons to a car, while the horses travel in two stock cars and the elephants in their own bull cars. Performers have their own sleeper, In a real circus, the advertising car, stacked with posters and circulars, travels three days shead of the show.

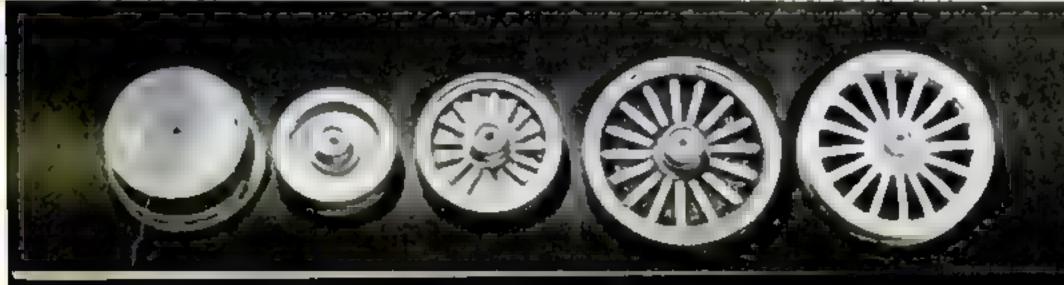

Some ingenious makeshifts Wagner has

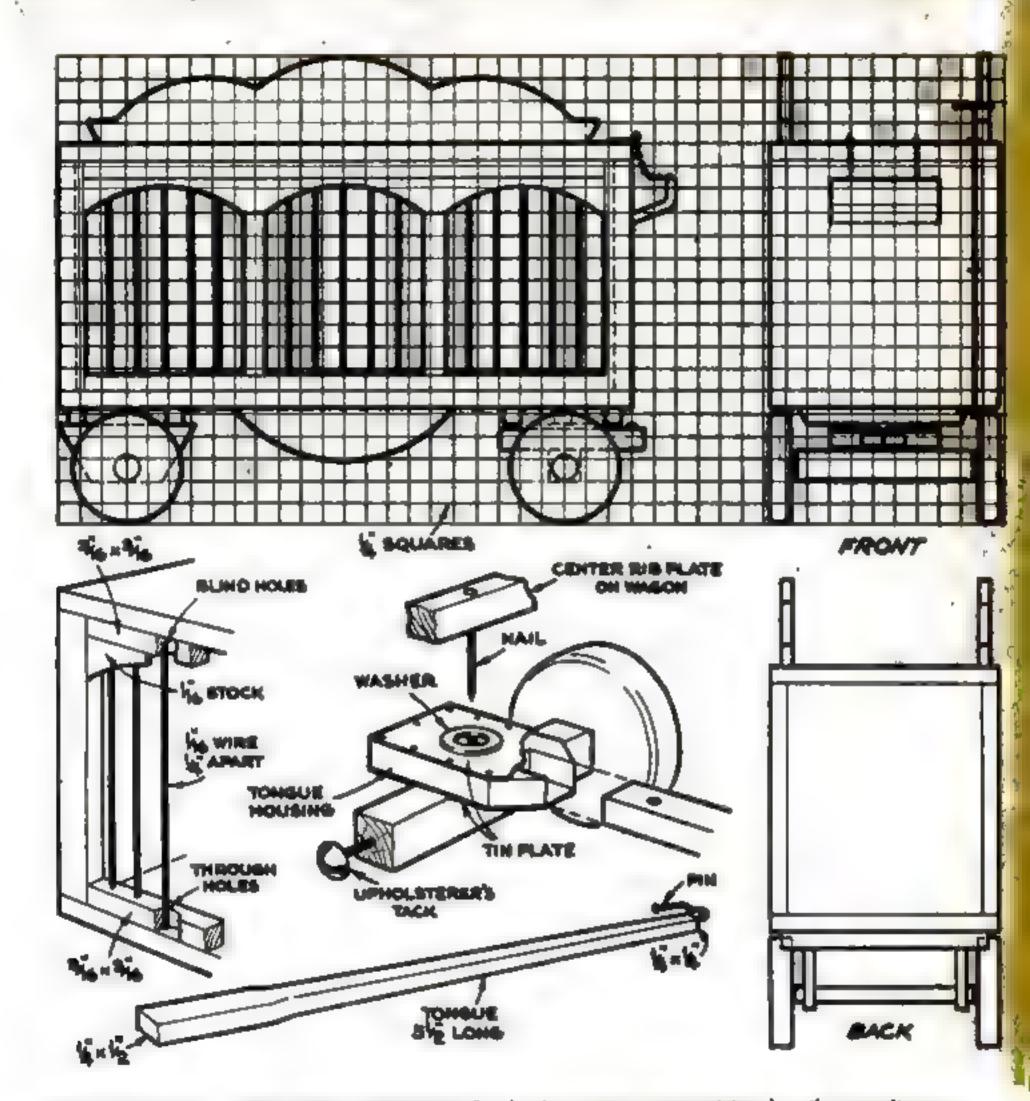

How the wagon body is attached to the front-wheel assembly. The hand gives an idea of the model s size

Decoration is mostly paint, but bottom flare is mode by cutting ridges, sanding, and filing

Wheels are turned on a lattle faceplate from disks of 14-lach yellow poplar. Spokes are added separately

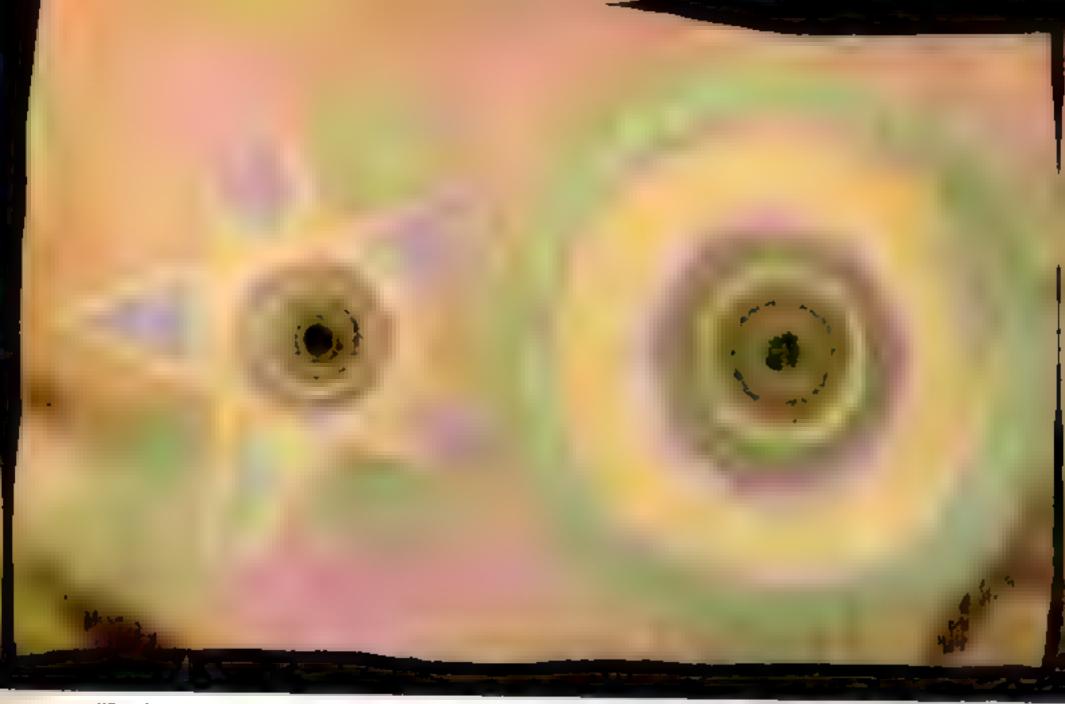

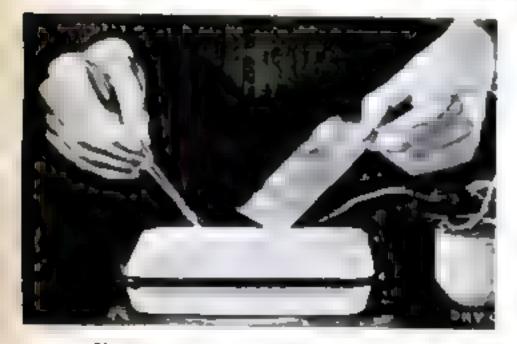

Side and end views, with details of construction for the den or cage wagon pictured on the apposite page

dreamed up are a tiny load of hay made of dried grass rolled together in a miniature baler, and several sawdust "bales," which are blocks of wood covered with glue and rolled in loose sawdust. Horses' plumes are chopped-up bits of pipe cleaner painted in brilliant colors. Red, white, and blue standards that top the wagons are made from tricolor satin ribbon mounted on slender dowels.

In the side show, the legless girl once topped a perfume bottle, the pumpkin-headed boy was stripped from a Halloween decoration, and the giant was an outsized toy figure. Tent making takes more labor and patience than you'd think. A pattern must be designed from memory of a real circus tent, and the "canvas" (heavy muslin) measured, cut, and tightly sewn. Holes are punched along the circumference of the cloth and fitted with metal cyclets. Through each of these cyclets passes the straight pin that tops the corresponding tent pole and anchors cloth to pole. The pole is secured by guy ropes—alender wrapping cord—which are tacked to the floor or table. The interior of the tents is carefully detailed, although this workmanship is rerely appreciated by a casual visitor.

"Rainbow" coated with molybdenum, this capper plate shows only one of the unlimited number of brilliant color patterns that can be produced by moving the positive anode over the plate

Plating both is hot solution of ammonium molybdate. Negative pole of four-cell battery is attached to metal plate; positive pole to the anode

2 The plate is laid on the bottom of the tray and the anode—a platinum wire projecting slightly from a glass tube—is dipped into the bath above it

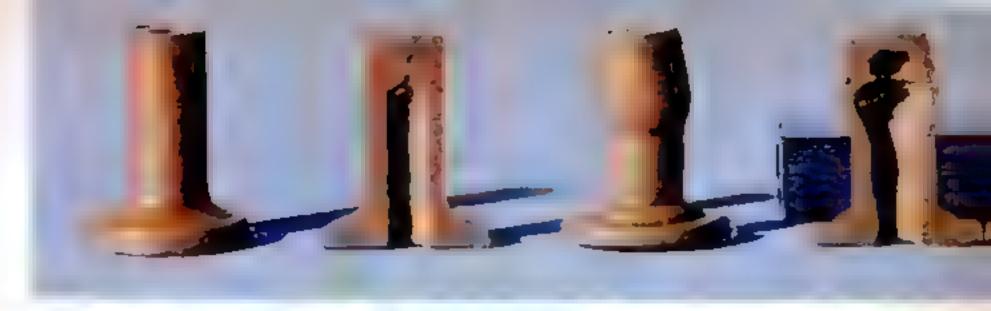

## Electroplating Puts Colors on Metal

RAINBOW" plating—a seemingly magical electrolytic process of applying multicolored designs to metal without the use of pigments—has been developed by the well-known electrochemist Oliver P. Watts. Secret of the process lies in lightwave interference between the surfaces of a semitransparent plating of molybdenum. As in a soap bubble, brilliant colors are produced by light reflection from surfaces only half a wave length apart. By minutely varying the plating's thickness, bues of the entire spectral range can be produced.

3 Color rings form as soon as anode is inserted and gradually expand, reaching plate's edge in about 30 seconds. Overplating makes colors vanish

PLASTIC RIVETS have been developed by S. H. Phillips, process engineer of the Douglas Aircraft Company's El Segundo, Calif., plant, for attaching fabric to metal, wood, or plastic, and metal to plastic sheeting. Tests have proved their strength and ver-

satility, and, owing to the colors obtainable the rivets promise wide adaptability to peacetime uses. Even greater than normal tensile and flexural strength is obtained by electroplating the plain rivets. The photos show the rivets and their application

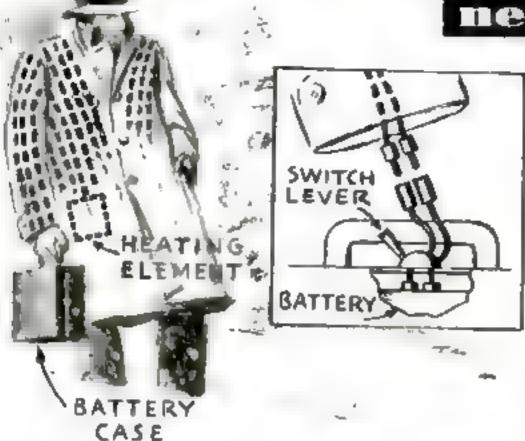

THIS GLASS WAS TOUGH. So was the gunner of the Ninth Air Force in the tail turret of the B-24 Liberator bomber. When a 20-mm, shell from a Nazi Messerschmitt struck the window, the gunner, whose view was obstructed by the damaged glass, continued to fire at the enemy and was officially credited with a kill

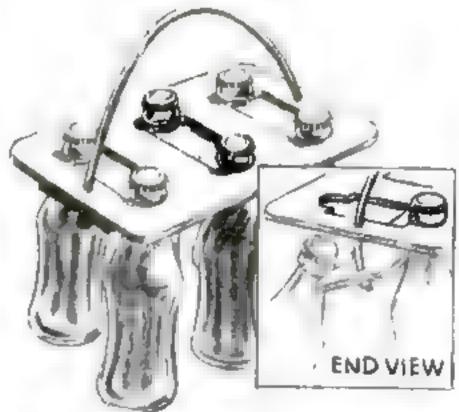

"GO FOR BROKE" is the motto of the loyal Japanese-Americans who compose the 442nd Combat Team of the U.S. Army. The expression is the equivalent of "Shoot the works." The Liberty torch shoulder patch shown above is the unit's insigne

#### new ideas from

NO NEED TO BE COLD winter if you take advantage of the idea of William W. Mo-Cready, Boston inventor, who has devised an electrically heated overcoat with an accompanying portable source of battery current. As in similar blankets and aviators' garments, heating wires are distributed through the coat. Two flexible leads are carried down the sleeve and are plugged into the battery carrying case. There is a convenlently located switch near the handle for regulating the heat, but when the battery is set down, the connection is broken.

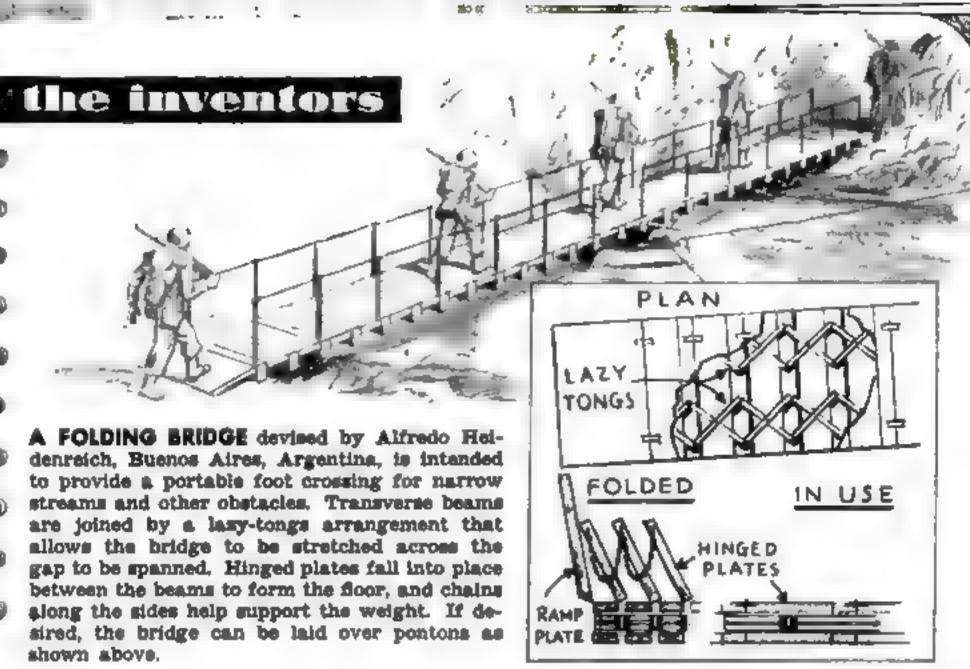

CARRYING POP HOME will be simplified by a new device invented by Keith W. and Clyde B. Burge of Gary, Ind. A slotted rectangular sheet of compressed paper board, plastic, or plywood fits over the tops of six beverage bottles, and an underpiece of the same material, secured by a stout carrying cord, is drawn upward to lock under the bottle heads. A snug fit prevents bottles from breaking by coming in contact with each other.

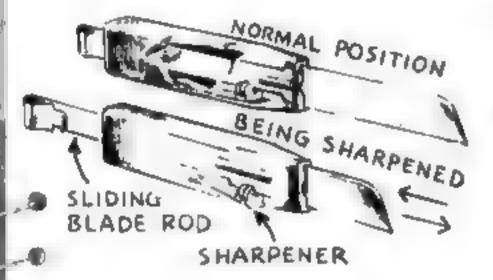

channel in which a weight slides, so that when the globe is placed on a desk or table its polar axis automatically assumes the correct inclination of 23% degrees from the vertical, corresponding to the tilt of the earth's axis with reference to the plane of its orbit. In this way, the globe dispenses with the usual clumsy stand. It can be moved and handled easily for study of any part of the map, or used to explain the changes of

the seasons.

A BETTER WORLD is promised by David E. Sites, of Chicago, in the form of a self-righting map globe for home or classroom use. Inside the globe is a circular

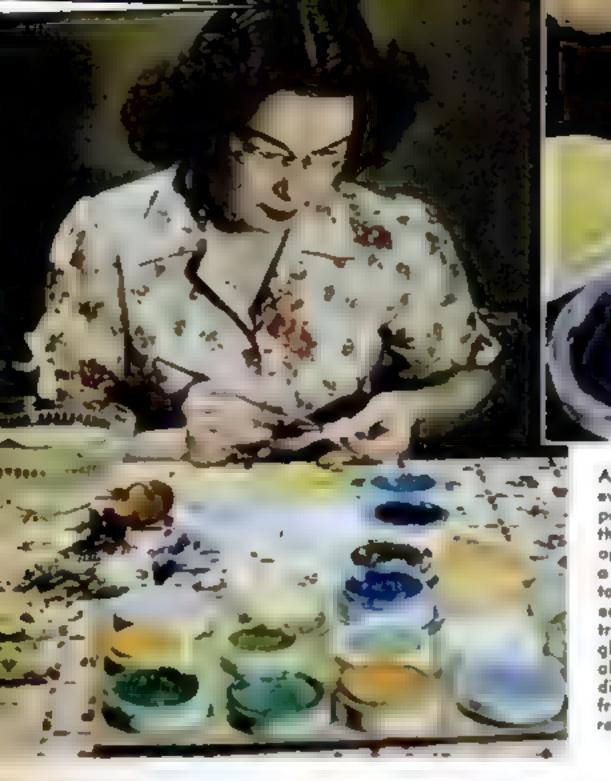

THIS KNIFE HAS THE EDGE on most other cutiery because it carries a built-in sharpener. Its hollow handle conceals a set of sharpening rolls similar to those found in nearly all well-regulated kitchens. When the knife gets dull, the user gives the metal extension at the base of the blade a pull-push motion, which carries the cutting edge back and forth across the sharpener. An easily workable locking device secures the blade in cutting position. Earl L. Frank, of Minneapolis, Minn., is the man who developed the idea.

HAND SNOWPLOW. Removing snow from sidewalks and driveways should be easy with a pusher invented by Joseph Leunis, of Scarborough-on-Hudson, N. Y. Somewhat resembling a lawn mower, the two-wheeled tool is fitted with a pusher blade and an adjustable handle that regulates the height of the blade above the ground. As a hand-powered bulldozer, the pusher can also be used for moving dirt, rubbish, and other material about the yard.

Although "ename!" has come to mean everything from dime-store paint to nail polish, actually it is finely ground glass that is strongly or weakly colored, and then applied wet to a base where it is baked to a hard, glassy finish. An assistant (left) to Harold Tishler, one of the few hand enamelers practicing the craft in this country, is shown applying a layer of colored glass to the little dankey that appears above. Each layer of glass requires an individual firing, at temperatures ranging from 1,200 to 1,500 degrees. The dankey required seven separate firings in a kiln

### HAND-FIRED GLASS ENAMELS

How costume jewelry, bowls, plates, and other ornaments are embellished with lustrous colors applied with a brush in layers and baked in a kiln.

N HIS small New York akylight studio, Russian-born Harold Tishler, a former landscape painter who has also studied ceramics, has found a lively career for himself in the almost extinct art of hand enameling—the painstaking handicraft of painting and baking finely ground glass, white or colored, on metal, glass, or pottery. Working with a tiny kiln that he has to keep fired 14 hours a day to meet the

#### SHAPING THE BASE AND FIRING ITS LAYERS OF GLASS

His metal bases properly cut, Tishler hammers them to shape on wood forms and then adds the "master's touch" by finishing the modeling with his fingers

A sulphuric acid both, a coating of gum—and a base is ready for its glass layers and many trips in and out of the kiln. At right, Tishler examines work

This zebra head (above and at right) is another of the costume pieces designed and produced by Tishler. The glaze is resistant to cracking and chipping, and should last a lifetime with careful handling. As a base for his enamels, Tishler uses either copper or silver, the latter producing beautiful tints of blue purple, and sea green when covered with translucent enamels. Although most colors are unchanged by the firing, a pink glaze is obtained from a white powder, and a purple glaze from a light blue

Photographs by William W Morris and Robert P Smith.

## DECORATE UNIQUE CRAFTWORK

demand, Tishler turns out exquisitely colored bowls, plates, and trays as well as pieces of costume jewelry that retail at 20 and 30 dollars. After the war, Tishler plans to produce decorative tiles for fireplaces as well as scenic plaques that can be set in living-room walls as murals.

These plates, too precious to be eaten from, are intended as decorations to be hung on the wall or placed over the mantelpiece. The iri descent hues are the result of a silver base and translucent enamel:

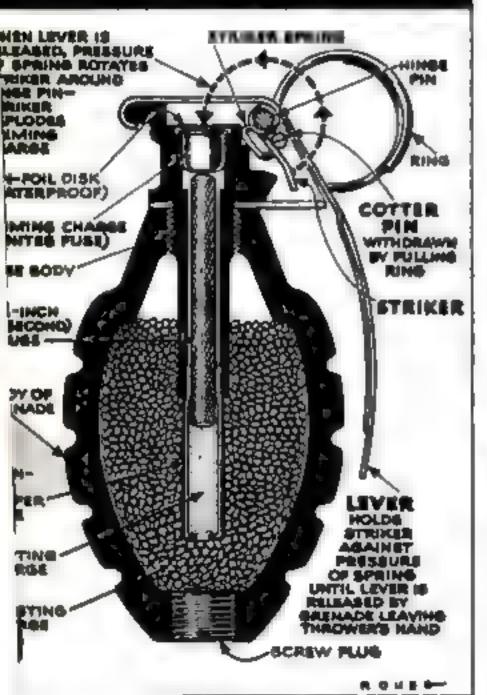

## "Get Good with the

Possibly the eldest firepower weapon, it is still a decisive factor in hand-to-hand combat. Here's the colorful story of its development and its role in war from the Middle Ages up to now.

By ARTHUE GEAHAME

## THE MECHANISM OF A

THE best thing that can be said about our fragmentation hand grenade is that the Japa are scared to death of it.

An ingenious and deadly contraption of cast metal and explosive, it looks like a somewhat oversize green lemon, costs 54 cents, and is simple to manufacture. It weighs 1% pounds. The average soldier can lob it 30 to 35 yards. A really good grenade thrower can drop it neatly into the lap of a Nip 150 feet away. Five seconds after it leaves the thrower's hand, it explodes and blasts 40-odd jagged fragments of its metal body over a 30-yard radius at 3,000-feet-per-second velocity.

The machine-made hand grenade of today is the direct descendant of what was perhaps the first firepower weapon. The Saracens probably used earthenware grenades when they besieged Balonika a thousand years ago; history records that bottles filled with gunpowder were used in the

#### FOUR OF THE PRINCIPAL

SMOKE

## Grenade . . . It Pays!"

siege of Casalmaggiore, in Italy, a half century before Columbus set sail for America. At any rate, the granade had become an important tool of warfare by the beginning of the seventeenth century. Even then, munitions makers must have known something about quantity production, for when the Spaniards attacked Ostend in 1602 they threw 50,000 granades at the defenders and the embattled Dutchmen hurled 20,000 back at them.

By about 1650 the hand grenade had become more or less standardized in the form of a hollow bronse, brass, or cast-iron ball

from eight to 14 inches in dismeter, weighing from three to six pounds, loaded with black powder, and exploded by a fuse lighted just before the missile was thrown.

Men who were husky as well as brave were needed for the job of grenade throwing, and in most European armies the tallest, strongest, and toughest soldiers of each infantry regiment were organised into special grenade units. For over a century these granadier companies played a conspicuous part in warfare, which then consisted mostly of attacking defending fortifications. eventually the improvement in small arms and the adoption of more fluid fighting tactics combined to rob the grenade of much of its effectiveness. Rifle granades date back to 1748, but they never were widely used in the days of the muzzle-loading musket.

In our Civil War both Federals and Confederates occasionally used grenades in the defense of fortifications. One type was the rampart grenade, a thinwalled, cast-iron shell loaded with black powder and exploded by a fuse which was lighted just before the grenade was rolled down the slope of the rampart on the attackers. In Tunisia, 80 years later, the Germans used grenades against us in a similar way. Manning the crests of the steep, bare ridges, they rolled hand grenades down on our advancing infantry.

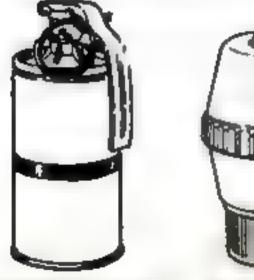

About 1870 our Army adopted Ketchum's grenade. This was a small, oblong cast-iron shell loaded with black powder, and it had two distinctive and revolutionary features—

#### A' NEW GRENADE LAUNCHER'

Designed for use on the Garand rifle, the launcher, which can handle entitask, hand-fragmentation, and 30 different types of signal groundes, is inspected by its designers, Colonel Charles H. Coutes and Ray S. Miller, foreman of the post ordeance shops at Fort Benning, Go. Prior to the new launcher, granades gould be fired only from Springfield rifles

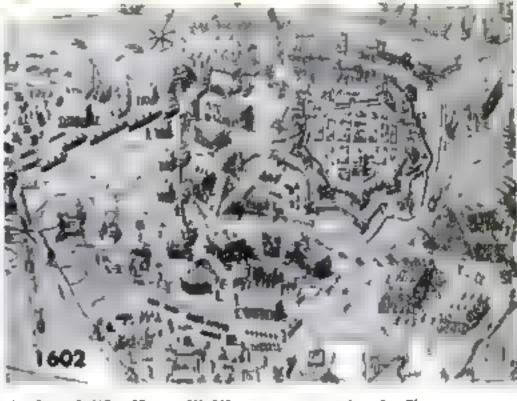

#### TYPES NOW BEING USED

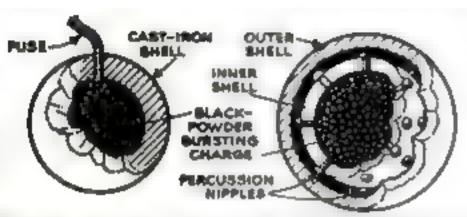

Manuscripts of the early 14th century show the grenade being used in the defense of besieged cities and castles. In 1602, at the siege of Ostend, over 70,000 grenades were hurled. They were also used by Louis XIV, by the Prussians at the Battle of Malplaquet in 1709, in the siege of Sevastopal, and in the Russo-Japanese war. Not until World War I, however, were granades of modern type introduced

## GRENADE SINCE 1650

Prenade of 1650 was to 14 inches in diamster, weighed three to six pounds. Fuse was hand lit

had range adjust-

ment to 300 yds.

a tail rod "feathered" like an arrow's shaft with stiff paper to insure its head-on flight, and a metal plunger, inserted in the grenade's nose just before it was thrown, which on contact with even a slightly resisting object detonated a percussion cap that fired the bursting charge.

Ketchum's was a big improvement over any previous grenade, but it soon was forgotten. Military men of all hations were sure that there never was going to be any more close-quarters fighting, that "modern" firearms had made it impossible.

They had to change their minds about that when the Japanese besieged the Russians in Port Arthur in 1904. The battle soon became a trench-warfare deadlock with the trenches separated, in many places, by a no man's land only a few yards wide. Under these conditions neither artillery nor rifle fire was effective, and both sides improvised hand grenades—the first high-explosive grenades. The Russians used old spherical shells and sections of brass artillery cartridge cases loaded with dynamite, and soon were producing a thousand grenades a day. The Japs used bamboo joints loaded with a pound of cast picric acid and filled with scrap iron. When ammunition ran short on Bataan in 1942, our men improvised very similar bamboo grenades.

Interest in grenade warfare induced by its effectiveness at Port Arthur was short-lived—the brass hats decided that the conditions of that struggle wouldn't occur again. But the extensive use of hand grenades by the Turks and Bulgarians in the Balkan War of 1912 had more effect. The British adopted, and produced in very limited quantity, a high-explosive grenade that made use of two of the features of our old Ketchum's grenade—tail streamers to insure its head-on flight, and a metal plunger to fire a detonator which exploded the bursting charge. The Germans adopted

several types of hand grenades and began manufacturing them in quantity.

At that time our Army wasn't interested in hand granades because our tacticians figured that the way to win a battle was to outshoot the other fellow at gradually decreasing ranges and finally run him off the field with a bayonet charge. But it some interested in increasing the firepower of the infantry, and for that purpose our first rifle grenade, the Babbitt, was adopted. Fired from the Springfield rifle, it consisted of a high-explosive-filled metal head and a steel tail rod grooved for ranges up to 300 yards. The range was determined by alipping into the proper groove a brass ring that fitted over the rifle's mussle and was acted upon by the expanding gases gen-

"ted by the burning of the powder of a . hal blank cartridge. The greater the length of rod inserted in the barrel, the greater the gas pressure and the longer the range. ... metal striker in the nose of the grenade was held away from the primer by a safety pin and, after the pin was withdrawn before firing, by a thin wire. When the trigger was pulled, the shock of the. propellant starting the rod out of the barrel threw the point of the striker against the wire, which it cut. The striker then hit the primer, which ignited a fuse. After burning for eight seconds, the fuse set off a detonator that exploded the bursting charge.

Before the outbreak of World War I, both the British and the German armies

#### RIFLE GRENADES OF FIRST AND SECOND WORLD WARS

The "Y. B." of World War I, which, In Improved form, we still use for jungle fighting. Mechanical details are below

Tranch warfare started as soon as the Germans were stopped at the Marne in the early fall of 1914. Possession of an adequate supply of effective hand grenades gave the invaders a valuable initial advantage in the grim war of ditches. The Allies at once designed grenades, but during the six months it took their factories to get into production the British and French soldiers had to fight back with improvised bombs—usually tin cans in which pieces of scrap metal, or even stones, were

packed around a charge of dynamite or guncotton.

The hand grenade continued to be an important weapon throughout the war, and many types were developed. The Germans' favorites were two models which they still use: the "potato masher," a stick grenade with a six-second fuse fired by a friction lighter, with igniter and wire pull inside the handle; and an egg-shaped percussion grenade weighing only 11 ounces, which the average German soldier can throw 50 yards. (Baseball men say that, from the

A War College sorganet shows some of the finer points of grounds pitching. standpoint of averting "glass" arms, 11 ounces is the ideal weight for an object that is to be thrown. League baseballs weigh only half that much because a light ball means a fast game for the fans.) The best grenade produced by the British was the one they still use most, the Mills. Its cast-iron body was grooved externally to insure good fragmentation. It weighed a pound and a half and was filled with three ounces of amatol, an explosive mixture com-

posed of ammonium nitrate and TNT. When we entered World War I our Army Ordnance Department adopted the Mills grenade, redesigned its fuse mechanism to make it safer for the thrower, substituted nitrostarch-base Trojan explosive as the bursting charge, and started large-scale production. Orders were placed for 68 million; 21 million had been turned out when the war ended. A concussion-effect high-explosive (Continued on page 207)

Jaan Fontaine and Arturo de Cardava make love on the deck of a seventeenth-century corsair in a scane from the Paramount Technicolar production, "Frenchman's Creek." Studio craftsman re-created the ship "La Mouette" of the story, building it around the hull of an old schooner

## Movie Shipwrights Build Pirate Ship

The Hollywood pirate ship on location at Albian Creek, in northern California For authentic backgrounds, the 110-foot vessel was put an a barge at San Pedra, towed 600 miles

JOLLYWOOD'S ability to provide almost anything needed for motion-picture productions is demonstrated again in La Mouette. the colorful seventeenth-century pirate ship built for the new Paramount Technicolor picture, "Frenchman's Creek." For movie purposes, an authentic background was needed, so the ship was rolled onto a barge and taken 600 miles up the Pacific Coast from San Pedro to Albion, Calif. Here she was launched by flooding the barge's air tanks until it sank. Then a tug pulled the pirate craft up Albion Creek to her location for screening. The picturesque boat is 110 feet long, and it stands 25 feet high at the stern. It was built over the hull of an old schooner

## When Not to Pull the Rip Cord

Bailing out at lew altitudes, a jumper need only each 10 before opening his 'citate. But at actromely high altitudes, where it is decirable for him to drop as fast as pensible through the dangerously sold and revolved air of the substratesphere, he each tube time enough to say a three-minute proper

#### Drawings by ERIC SLOANE

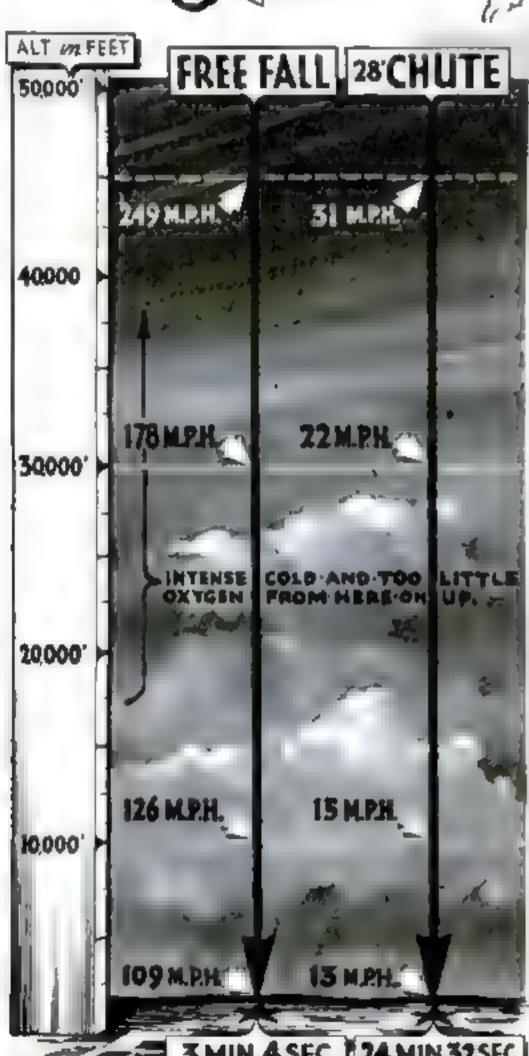

COUNT ten before you pull the rip cord" used to be the parachutist's watchword—and it's still good at low altitudes, where the main object is to get clear of the plane. But when you jump from the substratosphere, there's safety in a good, long free fall.

The reasons are shown in the diagram at the left. To begin with, a human body falls much faster through the thin upper air than through the denser atmosphere near the earth. At 45,000 feet, the speed is about 249 m.p.h, while near the ground it may be as low as 109 m.p.h.

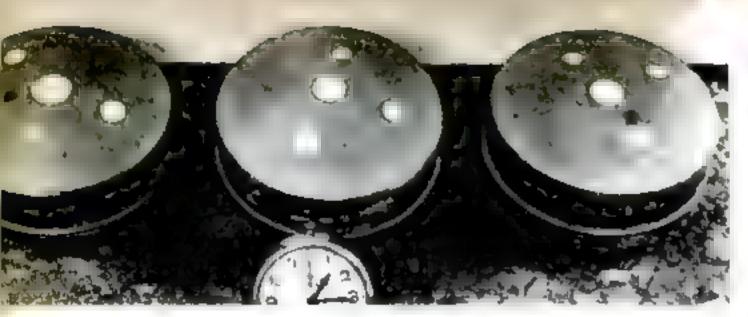

If the high-altitude jumper opens his 'chute too soon, the shock of deceleration—sometimes twice as great as in an abrupt pull-out from a dive can break his arms or legs, or map his neck.

Another reason for a long free fall is found in the intense cold and rarefied air encountered above about 17,000 feet. If the jumper travels too far through this sone at the comparatively slow rate of parachute descent (22 m.p.h. at 30,000 feet), he will land in an exhausted condition, even with the protection of warm clothing and a bail-out oxygen flask. For fighter pilots there is an added inducement for a long free fall in that it gets them out of range of enemy planes.

The drawing at the upper left shows the proper "stance" for a free fall.

DURATION OF DESCENTS FROM 40,000')

#### TESTS SHOW HOW RAIN DROPS CAN STEAL TOPSOIL

Soil samples, air-dried and screened, are placed six inches in front of a white splash board. Some coins are laid on top to shield part of the surface from the politing of artificial showers from the rain-making machine

After just 4% seconds of "rain," the soil samples are packed by the action of the drape. Splashes have carried soil to the splash board. Coins have not been displaced, but the surfaces of some of them have been muddled

Seventy-five minutes of rain of \$.6-inches-perhour intensity, \$.1-mm. drop size, and \$9.2-factper-second velocity has plastered the board with soil. Columns protected by agins show the original depth of the samples

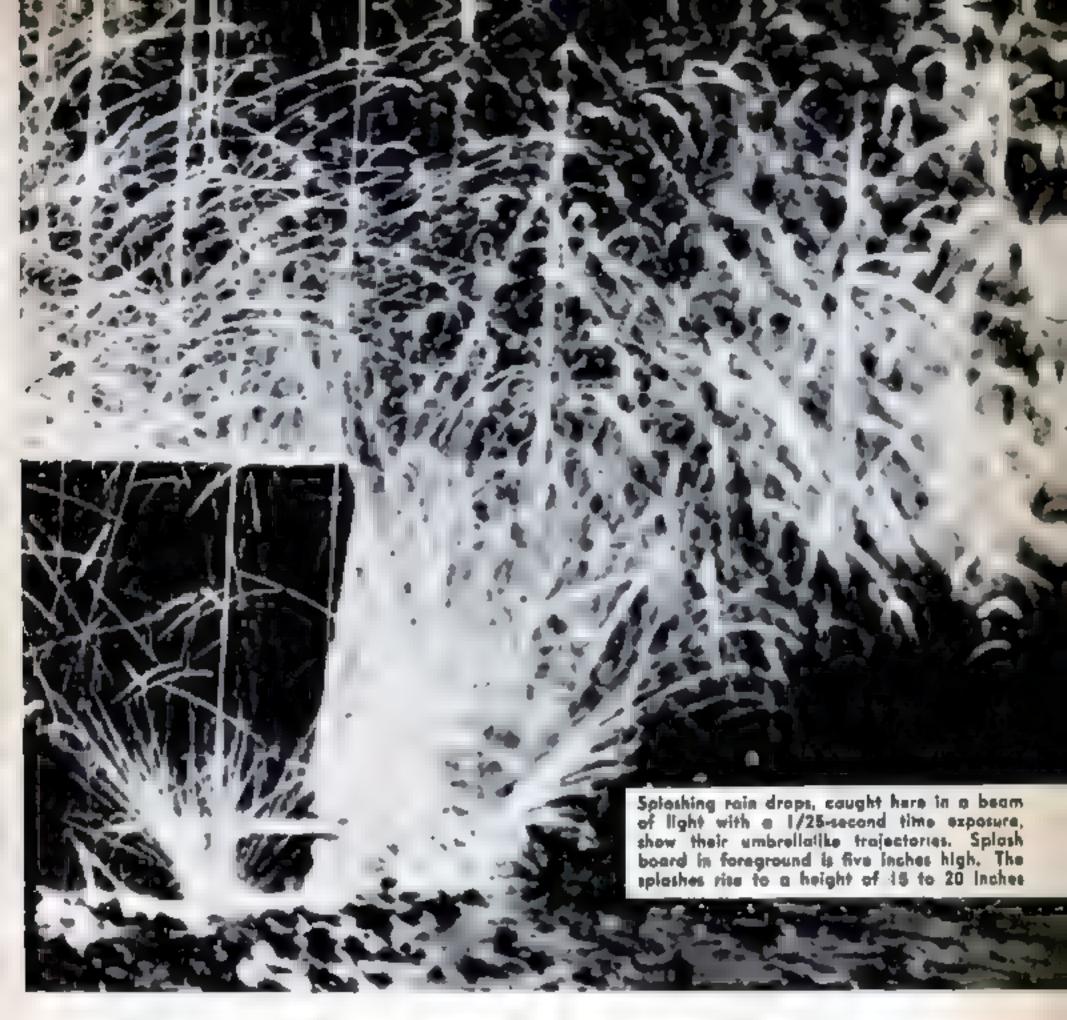

## **Tests Show How**

Science gives the third degree to an innocent-looking culprit that costs us billions yearly.

TINY rain drops, pecking away at precious topsoil, are responsible for a considerable part of the estimated \$3,844,000,000 damage done every year in the United States by accelerated erosion. Exact measurement of this earth-moving action of rain is now afforded in experiments conducted by W. D. Ellison at the U. S. Soil Conservation Ser-

vice hydrological laboratory at Coshocton. Ohio. Putting the culprit through a scientific third degree, Ellison has caught, weighed, and analyzed the soil carried by a rain drop's splash.

When a rain drop smacks the earth, the Coshocton studies reveal, the resulting umbrella-shaped splash shifts a bit of soil. On sloping ground, the downhill curve of the splash is longer and heavier, and the drop also usually hits the slope with a sidewise, digging blow. This results in a considerable downhill movement of soil, even when there is little accumulated washing or run-

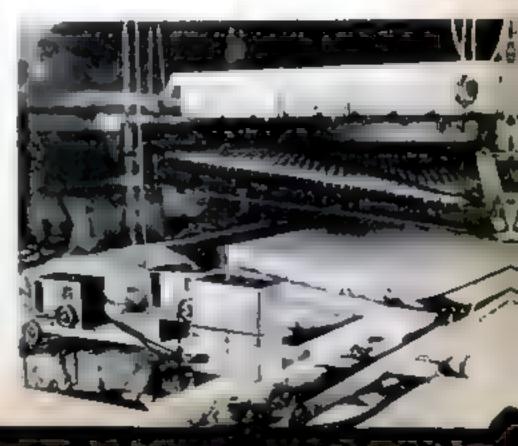

## Rain Drops Move Soil

off. Ellison proved by test that the splash of a rain drop can travel as far as five feet.

To foil this thief of topsoil, the Department of Agriculture recommends the planting of low, broad-leaved varieties of crops, and the leaving of a mulch of leaves and stalks after harvest. Further tests promise to help the farmer find new ways of outwitting rain.

RAIN-MAKING MACHINE duplicates natural showers of any desired intensity, drop size, and velocity. Water seeps through holes in the bottom of a tank anto cheesecloth stretched loosely over chicken wire, drips off lengths of wool yarn

ACCURACY in minimum-altitude bombing can be developed through gun practice (above) since, in a P-38, both bombs and guns are aimed with the same sight. Housed in the left bomb-rack fairing of the P-38 below is a 16-mm, movie camera which automatically begins to "shoot" the instant the pilot does. By photographing the plane's tracer bullets and the bursts of its cannon shells, it provides a record of the hits and also identifies the target. Note tiny window through which camera peers

How American flyers developed a new technique for needling the enemy. . . . Rocket planes vs. minimum-altitude bombers.

#### By HAL BORLAND

Drowings by STEWART ROUSE

altitude bombing. What it adds up to, under any name, is flipping a bomb into a target from close range and at high speed, using the plane as a kind of flying catapult. Skillfully done, it is devastating. And we have dozens of skillful minimum-altitude bomb tossers. They sank 22 Jap ships in the battle of the Bismarck Sea. They ripped Nazi supply lines and harried the tank columns up the Italian boot and across France. On the Pacific islands, they tore Jap defenses to pieces and battered airfields, supply columns, and troop concentrations.

Since the development of rocket launchers for planes, some of the jobs of the low-altitude boys have been taken over by Thunderbolts and other fighters fitted with rocket projectors. For some kinds of work rockets are better, but the treetop bombers still have a definite place in the picture.

Nobody knows for sure where the idea came from. Several pilots had noted that when a bomb is released from a fast plane at low altitude it follows a fairly flat trajectory, hits the ground, and skips. But nobody did much about it until the summer of 1942 when Brig. Gen. Grandison Gardner, commandant at the proving ground of the Army Air Forces Proving Ground Command in

" I KEELOP, ROMIRINACE

In the open, oltitude may be as little as 20 feet. In actual combat, it would use its guns as well as bombs

Bomb away! The "egg" follows closely the flight path of the plane. Below, the bomb explades after the plane has possed. Low-power charges are used in bomb practice

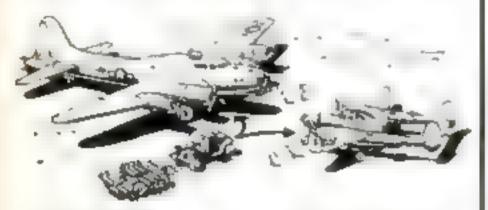

NOVEMBER, 1944

Photographs by HANS GROENHOFF

A NEAR MISS with a heavy bomb can be almost as effective as a direct hit. While rockets can demalish even massive installations, their comparatively light explosive charge calls for bull steve accuracy if they are to do their job

AVAILABILITY of bombs almost anywhere favors their use. Since the fighter-bomber uses the same kind of missiles as the regular mediums and heavies, it can be loaded from the supplies that are to be found at practically any air base.

Florida, began to have notions. He and Col. Surgent Huff, of Ordnance, went to work, looking primarily for a way to bomb tanks effectively. They had the pilots, the planes, and the bombs—and it wasn't long before they had a technique. Training for this type of bombing was advanced at the AAF factical Center in Florida.

a tickish job, because the plane must fly directly at the pier until the bamb is released, then climb sharply. The fuse gives about four seconds' grace

Others from the fighting fronts returned to the Tactical Center to work out problems, to learn new tactics, and to instruct other officers. Combat veterans showed these officers what could be done with their new bombing method. They went back to their commands, and in a matter of months both the Japs and the Nazis got their first taste of minimum-altitude bombing

One Air Force captain who did months of minimum-altitude bombing in the Pacific sums it up this way

It is highly effective because you can use any type of fast, maneuverable plane. You can use any size bomb, from the little 'i.i.s (!i.i.mentation bombs) up to 1,000-pounders. It is deadly against airdromes, lines of communication, shipping, railroads, highways, and trails. On the battlefield it can knock out tanks, troops, or gun emplacements. Surprise is the primary advantage; you come in so low and so fast that detectors have trouble picking you up. Defensive aircraft can't get you without risking ground crashes. Heavy ack-ack guns can't depress low enough or fast enough. Your accuracy is exceptionally high. And

#### Our Cover

ROCKETS can be used effectively to demalish a chain of gun emplocements, as illustrated here with a P-47 Thunderbolt, Since the projectiles hit ahead of the plane the pilot can correct his aim

you can bomb and strate on the same run a combination that's hard for any enemy to take "

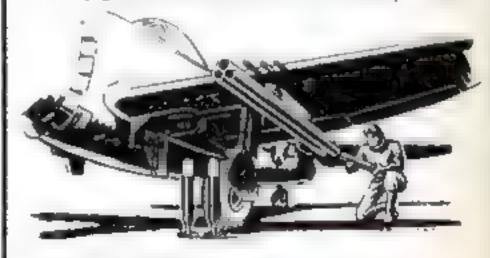

The ideal low-level bombing approach is at treetop height and at speeds up to 300 miles an hour. It is most effective in a rough, wooded country. The Pacific islands are perfectly suited to it, and the boys out there go darting up the valleys like swallows to pounce onto Jap airfields at 20 feet attitude or even less. There they cut loose with all guns in a strafing attack just before they begin to flip their bombs at the targets.

Two types of bombs are used. One is the ordinary bomb such as might be dropped from high-altitude, precision bombers, but equipped with delayed-action fuses that set them off about four seconds after contact. This delay is essential for the bomber to escape the bomb blast. The other type is the parachute bomb, usually a cluster of fragmentation bombs with an eight-foot parachute to slow it down; this type uses an ordinary contact fuse.

The bombing approach is usually devious. The bomber will often approach his objective from downwind, literally running ahead of the roar of his motors. His bombing run is seldom more than a few seconds.

The first minimum-altitude bombers on the African desert had their troubles as soon as the initial surprise wore off. The desert offered little cover for their approach and they were quite visible from the air, open to dive-strafing. But that problem was

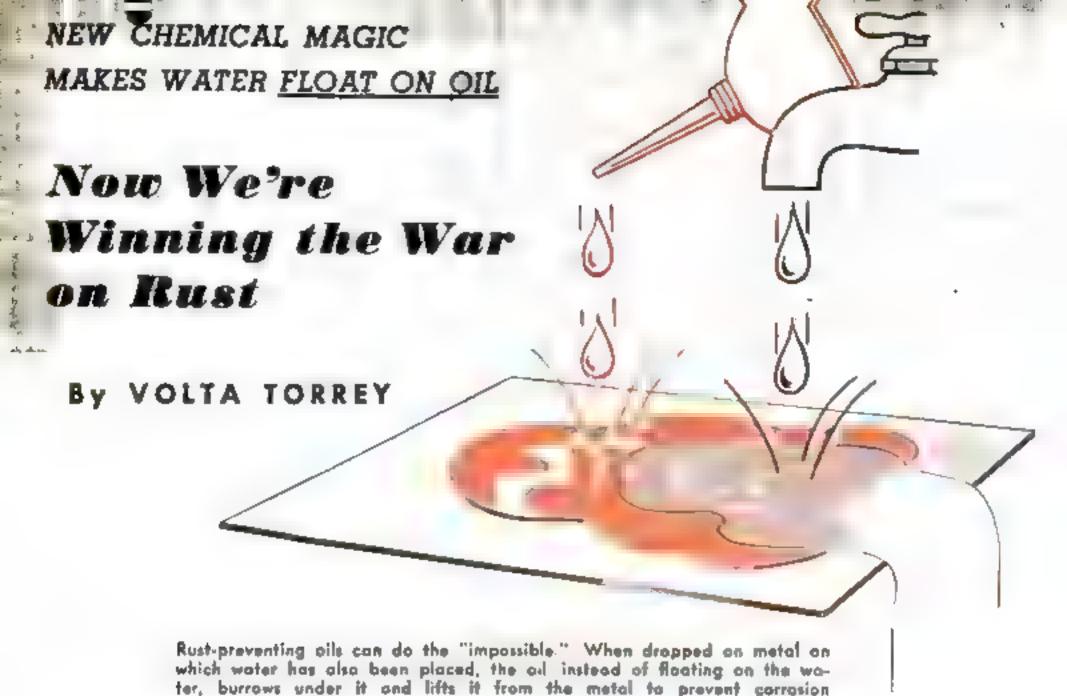

SELECTION OF FIRE. Any number of rockets, from one to the total supply carried, may be fired at a time. This enables the pilot to accommodate the striking power to the target. Also it may give him another chance if first try misses

EASY LOADING. Arming a rocket plane does not require loading cranes or abundant manpower. If necessary, the pilat himself can fill the tubes with projectiles. Racket fins fold forward for insertion in tube; wind pushes them back when fired

largely solved when somebody got the idea of painting their ships a pink sand color, which made them blend with the desert. Then they really went to town against Rommel's tanks.

They ran into other troubles when they began to rip Rommel's Mediterranean supply line to pieces. The ships were easy enough to get, (Continued on page 205)

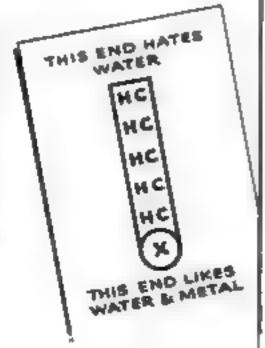

TO WAGE this war, Americans have had to defeat a much older, stealthier, and more persistent foe of civilization than the Japs. This enemy is rust.

It is a greedy and relentless saboteur of both swords and plows. As men have made more use of metal, losses resulting from rust have risen to billions of dollars a year. The British Iron and Steel Institute estimates that rust has claimed 40 percent of the 2,000,000,000 tons of pig iron produced in the half century between 1890 and 1940. Others declare that rust has done more damage than both fires and floods.

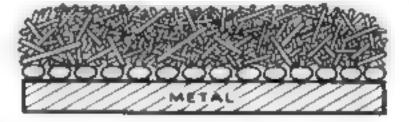

Rust is a reversion of metal to one or another of the forms in which it originally was found in the earth. Iron tends when wet, for instance, to unite chemically with oxygen and become an ore again. Water and oxygen

#### WHAT IS A POLAR COMPOUND?

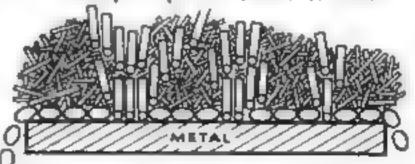

By adding atoms of nitragen, chlorine, asygen, or some other appropriate element to the hydrogen and carbon of asl, molecules of the oil are given a polarity in which one end is hydrophilic, or fond of water or metal, and the other end is hydrophobic, or averse to water

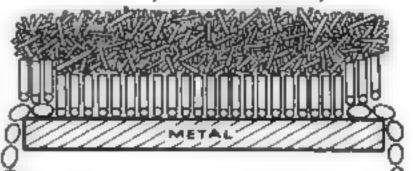

## HOW NEW OILS SEPARATE WATER FROM METAL

An ordinary ail, when placed an wet metal, is unable to prevent corrosion because of its inability to penetrate film of water

When polarized, oil molecules move toward metal, hydrophilic ends first, pushing water aside as they advance. Note key below

Othere invasion is almost complete, Hydrophilic ends are attached to the metal; hydrophobic ends hold rest of oil to the metal

OOO WATER

POLAR COMPOUND

are the most important single cause of rust, but it also may be caused by acids and fumes. Salts are catalysts that hasten it. So rust, in fact, may be caused by almost anything from a fingerprint to an ocean wave

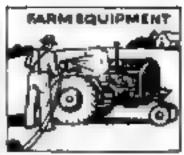

Some kinds of metal are less vulnerable than others. The corrosion of certain metals has long been known to form a coating that prevents further

deterioration. Recent research has traced the ability of nickel to resist corrosion to the arrangement of electrons in its atoms. Stainless steel and many alloys that are impervious to rust have been developed and more such products may result from the exploration of atoms. Much progress has been made, too, in coating metals that are susceptible to corrosion with sturdier stuff. Plating processes and protective paints have been used for many years to forestall rust, and such methods are still being improved.

Even so, some vital parts of modern engines, guns, and other machines still must be made of vulnerable metal that cannot be shielded from rust in any of these ways.

#### VITAL POSTWAR JOBS FOR NEW OILS

After the war, rustproofing oils will protect the householder's tools, will extend the life of wortime vessels awaiting new uses, will safeguard form equipment that has been put up for the winter

> These chinks in the armor of civilization might have proved fatal during this war if new means of checking corrosion had not been found in time.

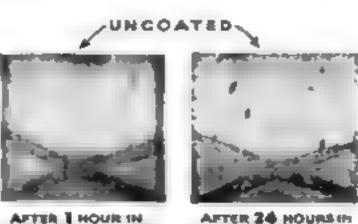

> World War I methods were not satisfactory; rifles sent to France then were coated with thick grease that took time, toil, and sweat to remove. This time, more complex weapons, ready for almost instant use. were required at more distant points under more hazardous conditions. Protection against corrosion has been needed in both the gnawing 130-degree heat and humidity of the tropics and the biting 40-below-zero cold and fog of the Arctic. Sait spray and engine fumes also have menaced precisely

#### PREVENTING CORROSION FROM FINGERPRINT STAINS

One of the most important jobs of rust-preventing oils is to remove the acids left by fingerprint stains. Precision-made parts of war-needed materiols can be ruined by corrosion resulting from the mere touch of a worker's fingers. To prevent this waste, which in some instances has ranged as high as 25 percent, studies have been made of the

corresive action of moisture from human hands. Women's futgerprints have been found to be more likely to cause rust than those of men, while the tauch of an Italian's or Greek's hand is thought to be more corresive than that of a northern European, For experimental surposes, investigators have developed a synthetic fingerprint liquid which is applied to metal that is their placed in a humidity cabinet (shown in diagram at the

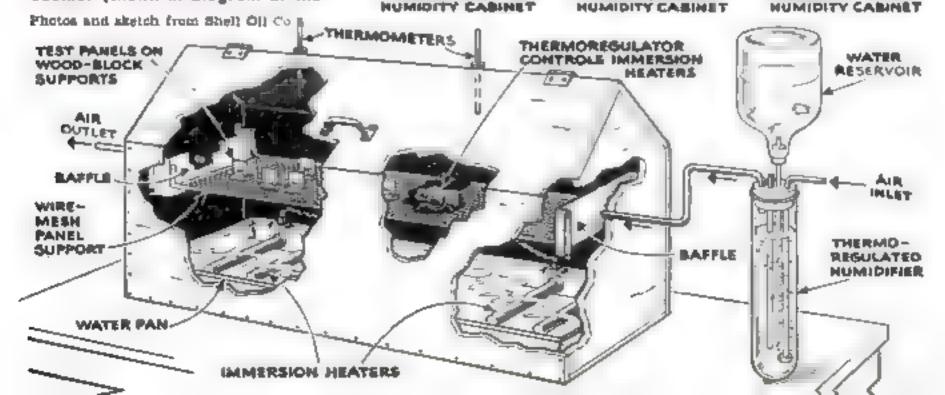

bottom of the page) to speed corrosion, Below, left, a metal piece untreated with all is shown after one hour and after 24 hours in the cabinet. At right, a metal piece that has been treated only with ordinary mineral oil. Fingerprint-stained metals that have been dipped in rust-preventing oils have stayed in the cabinet for hundreds of hours without corroding

AFTER 24 HOURS IN

made mechanisms. Materiel has been shipped as deck cargo and landed on damp beaches. If a single, sensitive part of a costly machine rusted, all the time and manpower devoted to making and shipping the whole machine might go for naught,

No one sure way of preventing all kinds of rust has been discovered. Selection of the wrong method, the Army has found, may actually hasten rather than retard rusting But grim necessity has sped the perfection of many new preparations and new techniques which, when properly used, are extremely effective.

Oils that inhibit rust by marching under water and forming a protective film on metal are an intriguing example. If you dip a piece of easily corroded metal into sea water, remove it, and cover the metal with ordinary oil, tiny specks of rust may appear on it in a few minutes because of the moisture remaining beneath the oil. But if, after dunking the metal in sea water, you immerse it in oil containing one of the new rust inhibitors, no rust will appear.

You can see why without a microscope. Put a drop of sea water on a clean piece of metal. Then place a few drops of oil containing the rust inhibitor near by. When you jiggle the metal slightly, the drop of water will be lifted from the metal by oil creeping under it. This replacement of the moisture by oil on the surface of the metal averts rust.

Even though the water is heavier than the oil, it will not seep through the oil and corrode the metal. It will be stopped by molecules which you cannot see but which have been mobilized by the chemists as military police to keep water away from metal

These molecules are synthetic substances known as polar compounds because of their chemical peculiarities. Like other molecules of oil, they are chains of hydrogen and carbon, but atoms of oxygen, chlorine, nitrogen, or some other element have been added to them. This makes them behave like little soldiers. Thinking of them as tiny troops, in fact, may help you understand what the chemists believe occurs when oil containing these compounds is applied to metal.

The addition of appropriate atoms to these molecules seems to make one end of each hydrophilic, or fond of water, while the other end remains hydrophobic, or averse to water. The hydrophilic end is drawn to either water or metal. But the hydrophobic end continues to cling to the other molecules of oil.

When oil containing polar compounds is put on metal, these little soldiers advance and plant their hydrophilic feet firmly on or in the surface of the metal. The hydrophobic ends bring the rest of the oil along

#### PACKAGING A P-51

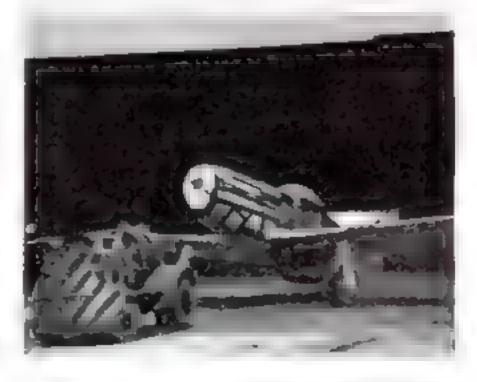

1 Ordinary gas and all are first replaced with a clear actions and a rustproofing oil. Engine is run for 20 minutes, drained, blown free of fumes

4 Guns come out of the wings, are given a heavy coat of rust-preventing oil, then reinstalled. Eight different oils are used to protect the ship

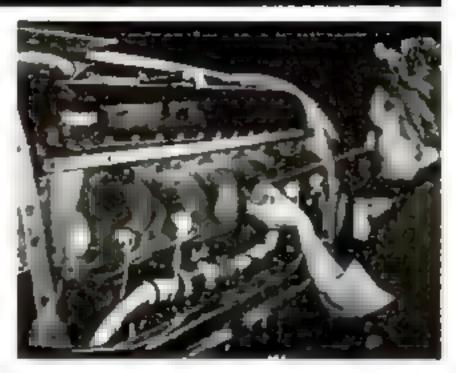

7 Thoroughly cleaned and airtight, the plane is towed out to get its final wropping. All open interior spaces have been given a coating of oil

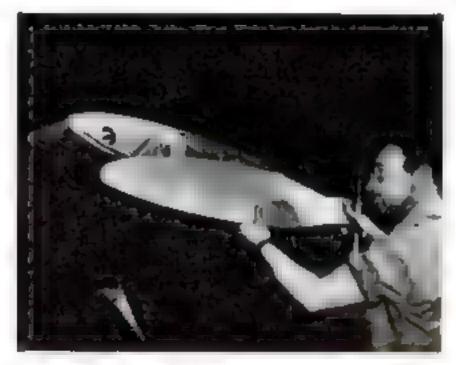

#### TO SAFEGUARD IT FROM RUST DURING SHIPMENT OVERSEAS

2 Spark plugs are replaced with adoptors (as in worker's fingers) to which are attached small maisture-absorbing tubes of silica-gal crystals

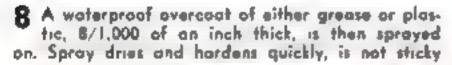

3 A sack of silica get also goes into each of the engine's enhaust stacks, which are then sealed with tape that is wound tightly around their ends

5 After wing tips are removed, openings are covered with plywood. Other openings left by removal of protruding parts are similarly protected

6 Instruments are not removed from the ship but are wrapped in ailcloth, tightly taped. Siticagel bag is hung in cockpit, which is then sealed

NOVEMBER, 1944

behind them, and thus bind the oil tightly to the metal.

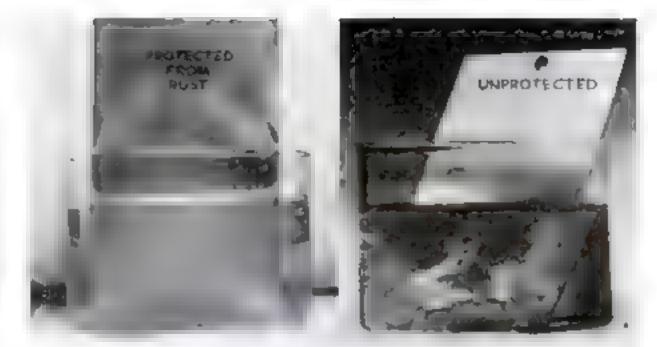

If there's a drop of water in the way, a company of these military police will surround it and auchor themselves to it with their hydrophilic feet. To do this, they will kick it away from the metal, and hold it off the metal with their feet. Some of them may have to stand on their other ends to do this, but they do it very well.

There are many kinds of polar compounds that can be put in oil to separate moisture from metal. Different compounds are used, in varying amounts, in

different kinds of oil, depending on the job to be done. A preparation for use indoors, for instance, may not be satisfactory outdoors. So producers of rustproofing oils have long lists of preparations, and the correct one must be chosen to obtain the best results.

One of the most important uses of polar compounds is to remove fingerprints. In many machines, nowadays, key parts must not be more than a ten-thousandth of an inch larger or smaller than specified. Such parts can be rusted and ruined by the mere touch of a man's finger.

The rotor shaft in a directional gyroscope is one of these delicate parts. Although the metal in it is worth only a few cents, the finished shaft is worth as much as a skilled mechanic earns in a day. Two thousand of these carefully made shafts once had to be discarded because of tiny specks of rust. Rejections of precision parts for weapons have run as high as 25 percent. In some

Courtest of Standard Oil Company of New Jersey

In the vessel at right, a wet piece of metal has been dropped into ordinary petroleum oil, but because the oil can't displace the water, rust is already beginning to form. The rust-preventing oil in the left vessel, however, has crept under the water to form a protective film.

plants, inspectors now examine such parts with microscopes.

Rust resulting from contact with human beings, consequently, is now being studied intently. Women's fingerprints have been found to be more likely to cause corrosion than those of men. Some investigators also believe that the fingerprint of an Italian or Greek is likely to be more corrosive than that of a northern European.

To test and perfect ways of removing fingerprint stains from metal, a synthetic fingerprint liquid, containing the following ingredients, has been produced:

( p	ercent
Salt (sodium chloride)	0 63
Urea	0.09
Lactic acid	0.36
Water	11 45
Methanol	87.47

The liquid is applied with a brush to the

metal, which is placed in a humidity cabinet to speed up the damage.

If not protected by an oil containing polar compounds, the metal may be seriously corroded in this cabinet within an hour. But the same metal, covered with the synthetic fingerprint solution, then dipped in oil capable of lifting that mois- (Continued on page 208)

Ball bearings used in gyroscopic instruments made by General Electric are kept under glass until used; are picked up only with tweezers; never touched by hand. Orling with special fluid is done with hypodermic needle

# AIR ROUTES PAD REST ROLLERS

In the free-rolling spherical map, small hales may be drilled through the major cities of the world so that the hacked and of a tape measure can be inserted in them for determining global distances

/HETHER we like it or not, the airplane is lifting us from a smug twodimensional world of charts into a round world of three dimensions. If we had not depended too much upon charts before Pearl Harbor, we would not have had a false idea of the position and importance of the Hawaiian Islands: Alaska would have loomed up as near to the Orient as it really is. One of the most important jobs for Americans of tomorrow will be to orient themselves to the rest of the world-to see our land as our global neighbors gee it.

Tomorrow's geography classrooms will be without the familiar wall maps, but will be built around giant-sized, free-rolling globes. Only such a globe will give the proper feeling of space. By turning the globe upside down, the student will escape the false idea that north is "up" and south is "down"; he will lose the cramped feel-

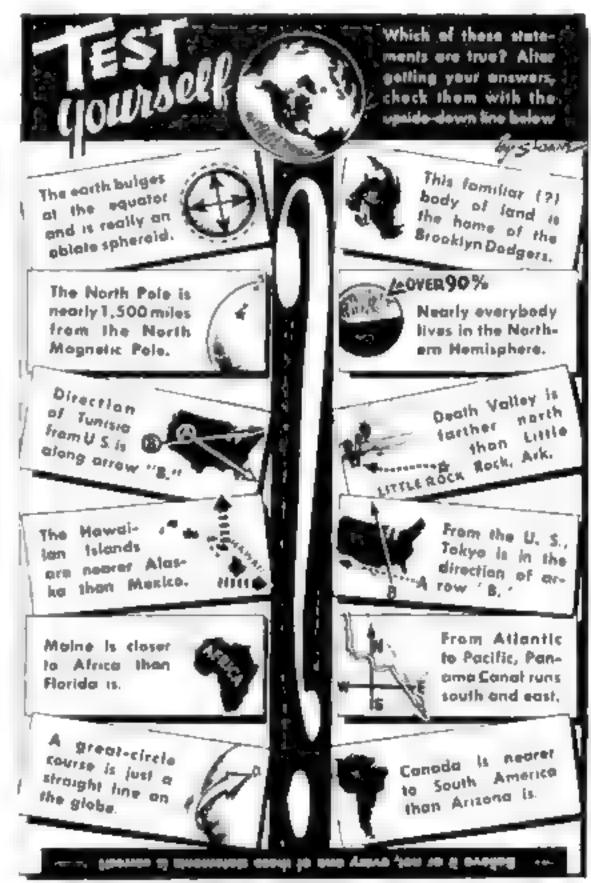

ing that all nations spread out from his; he will be able to view his shores exactly as his earth-neighbors do. Geographers admit that no flat map can even nearly give a true picture of the earth; why then, should schools continue to teach global geography from this type of map?

Look at the drawings above. If you are "of air age" you will be able to answer most of the tests correctly. Can you recognize the picture of North America when it is up-

side down, as the Arctic-route flyers will approach it? Can you realize that three fourths of the earth is covered with water? With all this volume of water, if the earth were absolutely smooth, all the land would be completely covered to a depth of 1½ miles.

Such comparisons, readily seen and completely understood through the study of a giant spherical map, are not easy to "feel" when looking at a flat map.

TERMITES LIKE MONEY. And the man who banked \$6.000 in bills under the wooden rafters of his hause provided an expensive meal for the insects. He sent the remains to the U.S. Treasury Department's Currency Redemption Division, and in two afternoons one of their experts identified \$4,600

## -BUT DON'T SEND ASHES

How Treasury sleuths identify charred, rotted, termite-eaten, and otherwise mutilated bills.

By LAURENCE D. SMITH

Photographs by WILLIAM MORRIS

The photographs illustrating this article are reproduced by special permission of the Secretary of the Treasury, and further reproduction in whole or in part is strictly prohibited by law.

ABOUT the time of the Japanese attack on Pearl Harbor—or, to be more exact, on November 30, 1941—there was \$9,903,-355,066 of currency in circulation, exclusive of the holdings of the Treasury, the Federal reserve banks, and agents. On July 31, 1944, \$22,526,812,783 was in circulation. This enormous increase has directly or indirectly affected the lives of all Americans; but it has affected no one more intimately than it has the remarkable ladies of the Treasury Department's Currency Redemption Division, Washington, D. C.

In time of peace, these women were already burdened with the most trying and nerve-racking sort of work, the identification of mutilated money. Now their labors have more than doubled-partly because of the increase in the amount of money in circutation, but also because wartime casualties greatly swell the volume of notes sent in for redemption. A half million dollars was received from a single ship damaged at Pearl Harbor. Unhappily, the labors of these cheerful though harassed ladies cannot be lightened by adding to the personnel. Many years of training and experience are needed to develop their unique skill. They have the ability to perform feats of wizardry that a professional magician might envy.

WHAT MUTILATED MONEY IS WORTH, Because it is less than 2/5 of the original note, the fragment at the left is worthless. More than 2/5 but less than 3/5, the fiver in the center rates \$2.50. With more than 3 5 identified, the charred remains of a twenty at right are redeemed at \$20

The presiding genius of these uncanny workers is Bertha Walker. On the day I called at Redemption Division she was seated at her desk with some hundred-odd bits of coal-black char spread out before her, and other thousands of fragments in pasteboard boxes.

"These charred remnants were sent to us in April," she explained. "There's supposed to be \$1,520 here

"A house in a small town out in Montana burned to the ground. The money was in a purse on the second floor and the flames spread so fast that it couldn't be retrieved. So far, I've identified quite a few tens and twenties, but no fives yet."

That she could identify even a single fragment seemed miraculous. The remnants looked like crumpled bits of plain black tissue paper and flakes that would float off if you spoke above a whisper. No trace of the design remained, so far as I could see, even with a magnifying glass.

"First I sort the charred remnants according to denominations," Mrs. Walker continued, "and mount

ROTTEN MONEY is definitely an unpleasant sight. When buts have been buried in the ground, they mold, decay, and often form a compact mass that is extremely difficult to separate into identifiable remnants. Here are the skillful hands of an expert reconstructing the remains of molded buried money

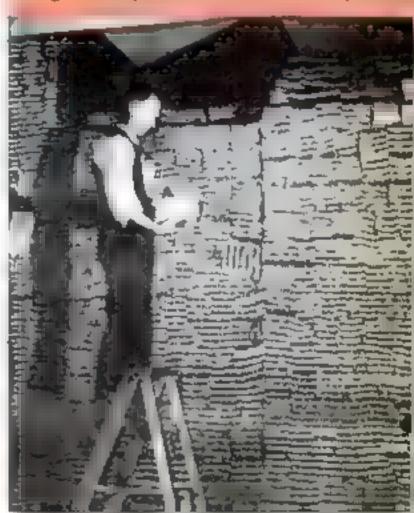

#### WHAT THE U. S. TREASURY DOES WITH WORN MONEY

Worn notes received from banks are sorte and classified according to their type "Fit" notes are then returned to circulatio but the "unfit" are destroyed according to la

- 2 A powerful chapper is used to cut the pin of bills in two lengthwise, after which th halves are carefully packaged in 1,000 to
- 3 Bundles of aut-in-half notes are stacked to await removal to the incinerator for buring in the presence of two Treasury official

IRRATIONAL BANKS. They are (top) a decayed shoe in which \$230 was buried; a moldy eyeglast case and wallet (center) that were plowed under by a farmer; and (bottom) a section of pipe closed with screw caps at ends

them on these oblong pieces of paper. They're just a speck larger than the bills."

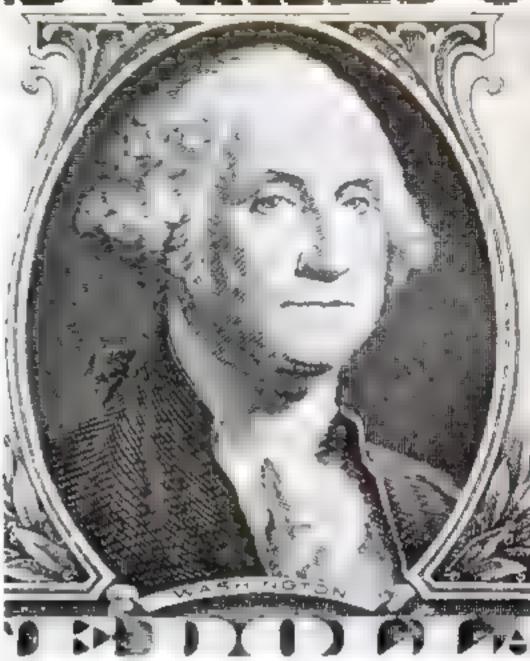

With tweezers she picked a larger fragment and placed it on one of these papers, and another on a different piece of paper. This went on for several minutes. Only rarely did she use the magnifying glass.

Now, apparently satisfied with her selections, she pasted a piece of char on the paper—another and another. Her fingers worked rapidly. She put the papers between blotters to remove the moisture. She picked up a tiny particle, studied it, and put it back. She picked up another bit and pasted it three inches from its nearest neighbor.

Mystified, I asked how she knew that that last bit belonged with the other fragments on the paper,

"Different notes burn differently," ahe explained. "Paper burns differently"

"But the paper's all the same, isn't it?" "Originally, yes; but the char of a crumpled note is different from that of a note that's still smooth. Age affects it, too. A note that's been handled a lot will be greasy, from the fingers, you see. The char won't be the same as the char of a new note. Then, when a note has been folded lengthwise, sometimes we can see the crease. That helps, because the creases are never exactly in the same place. And some people, especially women, fold the notes up into an oblong about the size of a calling card, so they will fit in a change purse. Face powder, lipstick, perfumethese are but a few of the very many things that have an ef- (Continued on page 209)

This is from a good dollar bitl. The autstanding feature of our notes is the mosterly engraving of the partraits, of which there is a different one for each denomination; so it's easy to spot raised notes

On the section of the good note below is indicated the security afforded by hand-engraved lettering. The serial number and the Treasury seal are on a separate plate and are printed in a different color

In a flash, pressure drops to 35,000-foot level. His chest bulges with imprisoned air

A couple of seconds later, he has his exygen mask on and signals "OK" to observers

Field, men go from 8 000 to 35 000 feet in a spit second

## WHAT HAPPENS TO FLYERS WHEN PRESSURIZED CABINS "EXPLODE"

OR a long time, men wondered what would happen to them if they were flying along at considerable altitude in a plane equipped with a supercharged cabin or cockpit and suddenly the pressurized compartment got a hole in it.

To put it another way, what would happen if flak or airplane-cannon fire carved chunks out of a supercharged fuselage in a fighter plane or a bomber at 40,000 or even 50,000 feet?

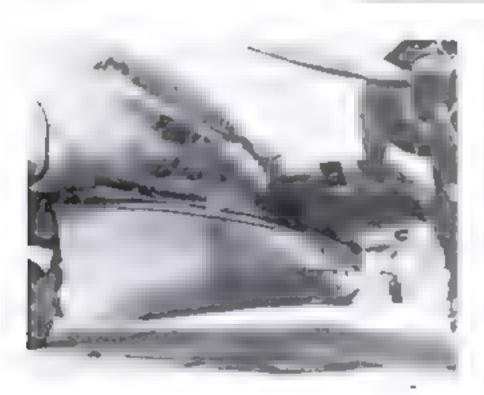

A good many fanciful ideas cropped up: It would be like popping a paper bag filled with air with your fist. The gush of air would assume gale proportions. Fearful things would happen to the body. If the stomach contained gas, its outrush would tear away the esophagus. Air seeking release from the lungs would main the tissue. Gases in the abdomen literally might explode.

Nothing like that happens. (Continued on page 206)

POPULAR SCIENCE

SIX-ENGINED NAZI BV-222 flying boat, originally designed for transatlantic passenger service, has been converted into a long-range patrol bomber. although little has been heard of it. Authorities thought it might have been converted into a military plane for bombing our east coast. It has a span of 150 feet, is 112 feet long, and weighs 100,000 pounds with maximum load. Its speed was around 200 mph, In conversion, nose and tail turrets were added to handle twin machine guns.

PLANE CARRIES BOAT. Reversing the role of the aircraft carrier, this Boeing B-17 Flying Fortress takes a 27-foot lifeboat aloft. Fitting snugly against the underside of the big bomber's fuselage, the "Flying Dutchman" is ready to be dropped by parachute to flyers or sailors marooned on an island or adrift on the sea. It contains food and equipment sufficient to enable the distressed mariners to make a 1,500-mile voyage, if necessary, to reach land or be rescued.

THE RATIO OF KILLS to combate has be nearly doubled since the introduction of British gyro gun sight into fighter planes. It was months ago. It consists of a number of electrical units that supply information to a sighting head in front of the pilot, who sees the enemy alreraft on a glass screen 4% by 2% inches (see below). The sight automatically makes all deflection allowances that may be required to register hits at 400 miles an hour.

#### What's New in Modern Living

PLYWOOD AND GLUE are used in this library cart built without nails by I. F. Laucks, Inc., of Seattle. The cart may be employed also as a stationary bookshelf.

AUTOMATIC DISHWASHING is done in a new sink accessory without a motor, belts, or a whirling spray arm, operation being simply on city water pressure. The machine is a product of Q. E. D. Dishwasher Co., of Alhambra, Calif. SHOPPING LISTS and household reminders are jotted conveniently on a wall memorandum pad equipped with ja per in a continuous roll that can be torn off in any length required The metal frame, finished in blue, white, red, or green, also contains a bracket for holding a pencil. Extra paper is available. The New York distributor ts Lewis & Conger.

Picking UP dropped articles or the daily paper is possible without stooping for anyone who uses this cane. It has a pick-up finger controlled at the handle. W. H. Mason, of Leesburg, Ohio, is the maker

when both hands are occupied, a phone may be held for use, as shown at the right, by a heart-shaped shoulder bracket made of wool felt and attached to the receiver. Hold-the-Phone Company, of Dayton, Ohio, manufactures the device.

He had silver eagles on his shoulders, prossed sabers on his lapel

## Gus fixes up a retread

#### By MARTIN BUNN

THE big limousine that drove into the Model Garage driveway was a good make and almost as old as it was good. As Gus Wilson slid open the shop door in response to repeated honkings of its horn, a brisk little Army sergeant hopped from the driver's seat. Gus noted that the hash stripes extended almost up to his elbow and that his legs had a bow not acquired in automobiles.

An officer stepped out as the sergeant opened the door of the tonneau and stood at stiff attention. He had silver eagles on his shoulders, crossed sabers on his lapel, and a mustache that verged on the handle-bar style and was startlingly white on a weather-beaten face. His complexion reminded Gus of the rich color that years of use, saddle soap, and care give good leather.

"Colonel Hawkesbury!" boomed the little sergeant in a big voice.

"Good morning, Colonel," Gus said.

"Mornin'," Colonel Hawkesbury replied with surprising mildness. "We've been havin' so much trouble I thought we'd better get some expert assistance—both Sergeant Brady and I bein' pretty much on the amateur aide when it comes to automotive equipment."

Sergeant Brady's red face turned purple, and he muttered something under his breath. The Colonel fixed him with a cold, gray eye. "What was that, Sergeant?" he demanded.

"I didn't say anything, sir!" Sergeant Brady snapped.

"Oh—I thought you did," the Colonel said. He looked at Gus and winked. "The Sergeant's a good man with horses, but he soon gets beyond his depth when he has to deal with transmissions. I have completed an Army course in motor mechanics, but—what's that, Sergeant?"

Sergeant Brady had emitted an involuntary choking sound. He cleared his throat. "Nothing, sir. I just coughed, sir."

"Oh, you just coughed," the Colonel repeated, and turned back to Gus. "As I was sayin' when the Sergeant coughed, I have completed an Army course in motor mechanics, but my practical experience has been limited. The Sergeant and I are changing stations, and are en route from Texas to Boston. We got along well enough until yesterday afternoon when the car began to behave in a most uncomfortable manner...

Just what were the symptoms, Sergeant?"

"Engine began to skip, sir," Sergeant Brady said. "After I'd slow down in traffic, the car would rush ahead in spurts no matter what I did with the accelerator. Pretty near ran us into a truck, sir."

"Yes—it was most uncomfortable and embarrassin'," Colonel Hawkesbury agreed. "The Sergeant suspected the fuel pump.

What did you do with it, Sergeant?"

"Took the fuel pump off and disassembled it, sir," Sergeant Brady said. "Cleaned it thoroughly. When I put it back on, the engine ran better. Once we got out on the road we did 35 as smooth as you please, But when we hit the next city it was the same old story-miss and jolt whenever I had to slow down below 20. Then half the time I couldn't speed up again. Sometimes even, all that stamping the accelerator pedal down to the floor boards did was to make the engine skip and jolt worse—it would start to race and all of a sudden go dead. Never had a car act like that before."

"My own diagnosis was that it was the distributor," Colonel Hawkesbury put in. "But, so far as is possible, I refrain from interferin' with an NCO who is in charge of a job, so I told him to do what he thought best. What then, Sergeant?"

"Well," said Sergeant Brady, "when I had disassembled and put back the fuel pump, the engine idled as smooth as anyone could ask. But as soon as we bit traffic it began

to act up again. That made me think that

mebbe it was the carburetor, sir."

Colonel Hawkesbury snorted, "Carburetor! We bucked and jolted into a town, and you worked on the carburetor all evening "

Sergeant Brady looked straight ahead and spoke briefly. "I examined it, sir. Took off the air cleaner. Checked and cleaned the float chamber and all parts. Blew the carburetor out with compressed air. Reinstalled it. Cleaned and checked all spark plugs-got a strong spark at each. Started the engine. There was a nice stream of gas flowing into the float chamber, and it idled amouthly. Road-tested the car, trouble as before, sir."

The Colonel gave Gus another wink. "Well, what did you do then?" he demanded.

Sergeant Brady looked injured. "One-thirty by then, sir, I went to bed."

"First sensible thing you'd done all day!" Colonel Hawkesbury said. "You never looked at the distributor, of course." He turned to Gus. "The Sergeant will tell you the rest of the story, and I hope you'll be able to find what's wrong. I must put in a longdistance call, May I use your phone?"

Gus took him into the office, "Thanks," the Colonel told him, "By the way—I wouldn't pay too much attention to what Sergeant Brady thinks the trouble is. He used to be the best stable sergeant in the Army, but since they've mechanized the cavairy he hasn't been able to keep up. No mechanical ability—none at all!"

Gus left the Colonel calling his number and went back into the shop. An astonishing change had come over Sergeant Brady. He had pushed his overseas cap far back on his head, disclosing a bald dome fringed by ginger-colored hair that was beginning to go gray, and he had a cigarette hanging

from the corner of his mouth.

"What's the old buzzard doing?" he asked. "Phoning? Good. Once he starts shooting the breeze he's good for 15 minutes. I've got to have a smoke—he's been riding me so hard I got butterflies crawling all over me. He used to be the best cavalry officer in the Army when they had hosses, but what he don't know about cars would fill a shelf of technical manuals."

Gus raised the hood of the venerable limousine. "I should think it would be pretty hard for an officer who doesn't know anything about automotive equipment to command a regiment these days," he remarked.

Sergeant Brady grinned, but his face wasn't happy. "The Colonel ain't commanding a regiment these days," he said grimly. "He's commanding an office full of Wacsand I have to sit out there with them and listen to their talk about their dates. Me and the Colonel-we're just retreads."

"Huh?" Gus asked.

"Retreads," the Sergeant repeated. "Injun fighters, if you like that any better. Guys who have been on the retired list and have got back in for the war. The Colonel retired 10 years ago, and I went with him—I've been with him, one way or another, most of the time since he was a second loosy fresh out of the Point.

"The Colonel's a fighter—he didn't get all those ribbons for sitting around GHQ looking wise - and he says we've got to get back in the Army. I told him we'd get put on some deak job, but he says he knows a way

"A State cop comes up and tells us you're a motor wizard"

to beat that—he'll get us sent to a motormechanics school, and after that we'll get back in the cavalry. He gets us sent to the motors school, all right. Of course he don't learn anything at it—no head for machinery. And then they put us on a desk job, just like I'd told him they would."

"I see," Gus said. "Well, now, about

your car · "

"There's something the matter with the carburetor," Sergeant Brady offered. "Or maybe the clutch is slipping. Must be one or the other—can't be anything else because I've checked everything. When we started out this morning, I had to toe the clutch in and out to give the engine a chance to get up some revs.

"We went along that way for miles. Then we had to stop because the Colonel said he smelled something burning. While I had my head under the hood, a State cop comes along on a motorcycle and wants to know what's the matter. Then he tells us you're a motor wizard and that your place is only a couple of miles up the road. So we make it here.

"Say," the sergeant continued earnestly, "don't pay any attention to what the Colonel says about the distributor. He don't know anything about distributors—and before we started on this trip I—" He stopped abruptly.

Gus looked up. Colonel Hawkesbury was coming through the office doorway. Sergeant Brady had undergone another quick transformation. His cigarette had vanished, his cap was at just the correct angle, his red face had lost all expression.

"Found the difficulty?" asked the Colonel.
"Not yet—but it won't be long," Gus said
confidently. "I'll have to do a little checking."

Gus Wilson never seems to hurry, but he works fast. He went over the gasoline line from tank to carburetor without finding anything wrong. "Nothing the matter with the carburetor," he said.

"I told the sergeant that yesterday," Colonel Haw'tesbury said triumphantly.

Gus got into the car and started the engine. It took off well enough and ran

#### GUS SAYS:

With cold weather due, remember that short runs which don't let the motor warm up increase condensation and oil dilution. If you must make short runs, change the oil often. Better still, don't start your engine unless you can let it get thoroughly warm.

amouthly at idling speed, but when he pressed his foot on the accelerator it began to miss badly. He turned the ignition key and got out.

"Try the distributor," said the Colonel.

"I'm going to," Gus told him. "From the way your engine runs, I'd say there's something wrong with the ignition." He took off the distributor cap and examined the points. They were badly burned and pitted from excessive arcing. "Yes," he said, "the trouble is in the ignition—and my guess is that it is caused by the condenser."

The Colonel looked at the Sergeant, and the Sergeant stared straight ahead.

Gus smothered a grin as he reached behind the massive old distributor to where the condenser was grounded to its housing by a screw

"Here's the cause of your trouble," Gus reported. "Whoever installed that distributor forgot to tighten the condenser grounding screw. After a good many miles of driving, vibration—or maybe rough roads—shook the condenser loose, with the result that the arcing of the high-tension current across the distributor points made your ignition go haywire. You'll need new points and—to be on the safe side—a new condenser."

Sergeant Brady looked at Colonel Hawkesbury, and Gus saw that his blue eyes were biazing. The Colonel's face was red under its mahogany hue. "Do whatever is necessary, please," he told Gus.

Gus installed a new condenser and points, and the Colonel handed him a bill. When he came back from the office with the change, Colonel Hawkesbury and the sergeant were already in the car. Their faces were flushed, and they were quarreling.

"Sergeant," the Colonel snapped, "I told you yesterday it was the distributor. If you hadn't been so buil-headed—"

"It was your fault, sir" Sergeant Brady interrupted. "I caught you fooling with that distributor the day before we started this trip. When you give a man a job to do, sir, it's only fair to let him do it without interference -"

"I've already told you I'm sorry, Sergeant," the Colonel said. "From now on, do what you please with the car. I'll never touch it again. Now, if it were a horse—"

Sergeant Brady grinned widely over his shoulder. "If it was a horse, sir," he said, "we'd both know a lot more about it!"

The old limousine rolled out of the shop, its engine purring.

Gus was still chuckling when his partner Joe Clark came in and asked, "What you been doing, Gus?"

"Oh," Gus said solemnly, "just a little job of fixing up a retread."

#### IDFAS

AUTOMOBILE DESIGNER Delmar G. Roos. shown above with the first Willys jeep, which he engineered, is no newcomer to the field of Army personnel-carrier design. In 1917, he turned out six special Locomobile sedans

for General Pershing. These cars bad double rear wheels and were equipped with six-cylinder, 120-bp, engines. Each was tested to 100 m.p.h., the speed required by Pershing before acceptance.

MAINTENANCE PROBLEMS In the Army, where unusual driving conditions—such as blackouts, narrow roads, unfamiliar terrain, and fog-combine to cause many accidents, challenge ingenious GI's to improvise tools that speed repairs. Typical is the wheel press shown at the left, the product of M/Sgt. Donald Guger. It is used to straight-

sists of an iron frame, a shaft to hold the damaged wheel, a length of rod that is employed as a marker, and a portable power press. The wheel is spun on the shaft with the marker riding on the rim; uneven apots noticed are marked; then each spot is brought under the press so corrective pressure may force the wheel back into alignment.

en wheels and conand

ELECTRICALLY DRIVEN, the midget vehicle shown above was built by John Bowker, left, of Melbourne, Australia, after three years of experimentation. With him in the picture is his brother Len. The little car has a top speed of 30 m.p.h. It recently ran continuously for 111 miles in a test of battery endurance. To recharge the batteries costs about 50 cents, and other operating expenses are said to be equally low.

LIQUIFIED PETROLEUM GASES, which remain liquid only as long as they are kept under pressure, and which expand and contract with temperature changes, are difficult to move. To overcome this difficulty, the Heil Company has developed the special trailer shown below. The tank has a capacity of 4,000 gallons and will withstand a pressure of 250 pounds per aquare inch. Since it is underslung, its center of

gravity is low. It is made of welded hightensile steel of a gauge so light that the body weighs a ton less than does a conventional unit.

# What You Can Do

#### By TOM McCAHILL

ROUGH engine idling has caused as much perturbation and downright exasperation as almost any other automobile allment. To a driver who has experienced it in only its mild forms, it may seem insignificant; but this frequently occurring trouble has turned many a hair gray on service managers' heads. Owners have been known to trade in their cars or sell them outright just because of this one annoyance. A car may perform beautifully on the highway or while climbing hills, but if it vibrates like a jitterbug while waiting for a green light, all pride in ownership soon disappears.

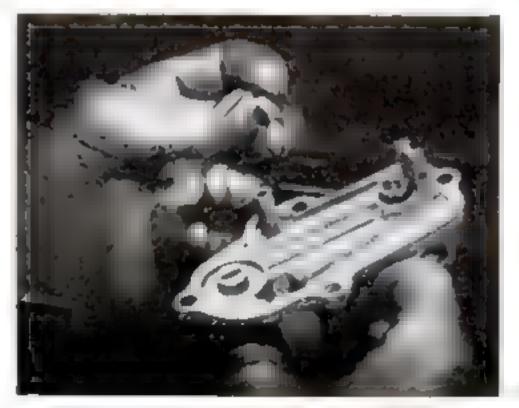

There are many causes of rough idling, some so simple they are often overlooked. One common remedy often resorted to is to increase the idling speed on the carburetor-throttle stop. This undoubtedly smooths out vibrations, but it is pretty hard on the ration book and is certainly not a real curs. In a recently conducted survey, it was found that more than 50 percent of automobiles tested at random idled at speeds ranging from 500 to 700 r.p.m. Compared with a normal idling speed of 400 to 500 r.p.m., this indicates a serious waste of gas, coupons, and money.

The most frequent cause of rough idling by an otherwise efficient engine is an overrich mixture resulting from flooding of the carburetor at idling speeds. It is a fault that is often difficult to spot because the flooding is internal and the vacuum in the intake manifold absorbs the excess fuel before it can be seen. This type of flooding should not be confused with that customarily experienced when the choke is used too freely and which is readily apparent both from refusal of the fuel to burn because of lack of sufficient air and from the noticeable smell of the overflowing gasoline.

Several things can cause internal carburetor flooding, but the most likely is the needle-valve and seat assembly in the float chamber. The needle valve and seat maintain a constant level of fuel in this reservoir when they are functioning properly. If they allow gas to continue its flow after the shutoff level has been reached, they should be inspected for defects. Sometimes even a small piece of dirt or a hair resting under the needle will keep it from closing as fully as required and thus prevent the proper halting of the flow at the shutoff point, If the car has been in use for a long time, the seat may be worn or the needle bruised. In a case of this kind, it is wisest to replace the unit with a new needle valve and seat,

Another thing to check in a flooding carburetor of this kind is the float, which may be leaking and thus failing to rise and close the needle vaive. Such a leaking float is best replaced with a new one, though a satisfactory repair can sometimes be made

Perfect seating of the corburetor needle valve is essential. A speck of dirt or a hair may allow gos to continue to flow at the shutoff position

#### A CONCRETE MIXER WHEN YOU STOP AT A LIGHT?

# About Rough Idling

by drilling a small hole through the crack or other leak, letting out the enclosed gas, and then lightly covering the hole and remaining crevice with solder. It's desirable, of course, to make as little a change in the weight of the float as possible.

A mixture that is too rich can also be caused by a too-high setting of the float. The high level floods the carburetor at idling speeds and causes the engine to roll and stall at what is considered a normal setting. Frequently the cause is a float hinge that has been bent during overhauling, or bad needle wear that permits the float to rise higher than it should before shutting off. A bent hinge can be bent back easily, but a float-level gauge should be used in making the final setting.

One contributor to flooding that is rarely checked is an overpressured fuel pump. This causes the needle to bounce back every time the pump pulsates, forcing additional fuel into the float chamber. The float assembly is gauged for a specific pressure, and when this pressure is passed the carburetor will flood. A usual cause is wear in the pump linkage. It allows the pump arm to develop a whip and build up undesirable pressure.

While examining the carburetor, don't overlook the idling jet. This unit may be partially or fully obstructed by foreign matter. If it is fully obstructed, no gasoline will pass through at all, and at speeds below the intermediate-jet range the engine will stall. A partly clogged jet has the same effect to a lesser degree, causing the engine to buck, roll, and come to a stop. Enriching the mixture through the idling

adjustment is only a partial remedy; the obstruction should be located and cleaned out.

Incorrect timing is another frequent cause of rough idling, and it may be the result of one of several conditions. first step is to look at the locked timing position of the distributor body, which may have been set in advanced position through carelessness on the part of some mechanic. Slight inaccuracies in the timing are often overlooked in the effort to improve idling, since as a rule they affect road performance only a little. This slight difference, however, results in a lot of engine rolling, bucking, and stalling. Distributor points that are set too far apart may be responsible, for in such a case the points will break several degrees before the normal requirement and cause roughness, since the piston will still be on its way up when the explosion occurs. At fast speeds, the engine may appear to be running efficiently because the increased speed of the piston in relation to the time of the explosion will overcome some of this advance.

Incorrect spark-plug gaps are another cause of early advance, and spark-plug settings have ruined the reputation of many mechanics and service managers. You may have had the experience of installing a new set of spark plugs only to find that your engine ran better with the old ones. The new plugs were all right, but they were gapped too close for smooth idling. Most spark plugs come from the factory set at 025" or less. This gap works perfectly for for some engines, but for others it causes roughness at low speeds. [Turn the page.]

In adjusting a float level that is too high and thus permits an overrich mixture, be sure to use a float-level gauge in making the final setting On some cars, widening the spark-plug gaps from the normal .025" to .035" or .040" lets pistons "ride with the punch" while the engine is idling

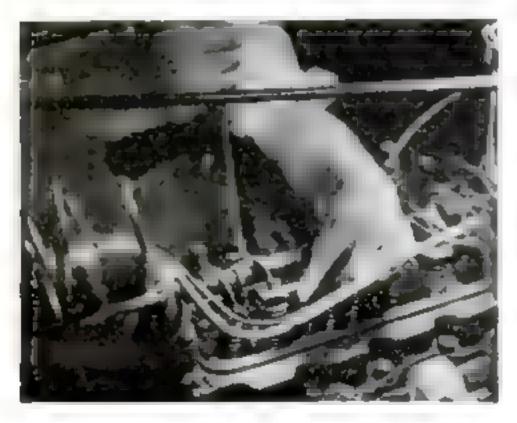

Practically all engines will idle smoothly on a slightly retarded spark because then the piston will have reached top dead center or a little beyond when the explosion occurs. This situation may be compared to riding with a punch in boxing—the piston goes along smoothly instead of taking the full smash of the explosion—and this is an effect greatly to be desired in an idling engine. With increased speeds, the automatic spark advance will see to it that the spark is delivered in time to give the most effective wallop.

A wide gap (.035" to .040") in the plugs will retard the spark slightly at idling speeds because the potential must build up for an instant to gather enough power to jump the opening, while with a close gap

Distributor points set too for apart will open while the piston is still on the upstrake. This may not be noticed at fast speeds, but it will make idling rough

Decreasing valve-tappet clearance, sometimes resorted to by mechanics to eliminate valve noises, is a cure far worse than the fault—it puts bumps in the engine

the spark leaps across without hesitation. The difference close gaps of .020" to .025" and wide gaps of .035" to .040" make in the performance of some engines is almost unbelievable. However, widening the gap will not work for all cars for the reason that some manufacturers have provided enough automatic spark advance to cover all ranges and speeds. When preparing to set the gaps on your car, it is best to consult your manufacturer's manual and follow its recommendation. And don't attempt to use a dime to gauge the adjustment; use a gap gauge.

Valve-tappet clearances that are set too close are also often the cause of bumpy idling. This condition is most frequently found in engines of the overhead-valve.

type. The reason for this is that an overhead-valve engine lends itself more readily to tappet noises, and to eliminate them mechanics too often set the valve clearances closer than the manufacturer intended. As a result there are lumps and bumps in the engine performance, and the cure may be found to be far worse than the original fault. In an overhead-valve engine, tappet noises can be eliminated in most cases and the proper clearance can still be retained if care is exercised. In cases where this cannot be done, it is far better to have a little noise that means nothing than to have a rough engine.

There are a number of other conditions that cause or contribute to rough idling, but they will be encountered rarely. A leaking intake manifold, for instance, can cause an engine to cut up surprisingly when it is running at slow speeds. Another villain-also fortunately rare, for it would be easy to overlook—is a faulty radio suppressor. A high-tension leak in the suppressor wiring can cause havoc. So can a leak vacuum-type spark control. Warped valves will very often function satisfactorily at comparatively high speed, though they may stick and cause roughness when the engine is idling. Faulty compression also will cause unevenness, and so will an automatic spark governor if it sometimes sticks.

But these are rare conditions. The chances are that if your engine is a rough idler you will find the cause and cure among those detailed in the preceding paragraphs. It will be good practice therefore to look first to the carburetion of the offending car, then to the timing at the distributor and spark plugs, and next to the valve settings before you start hunting for more or less obscure causes.

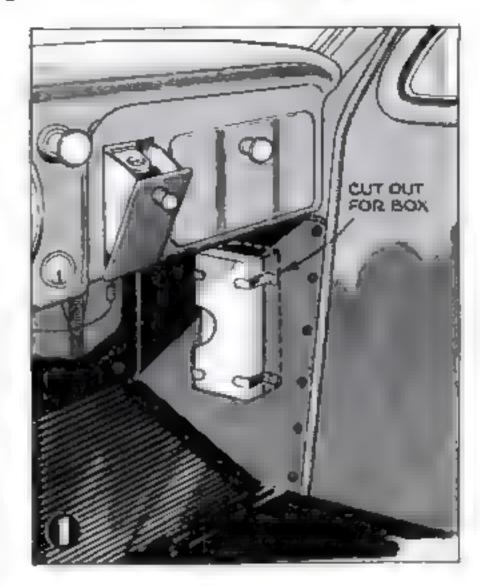

# USEFUL AUTO HINTS

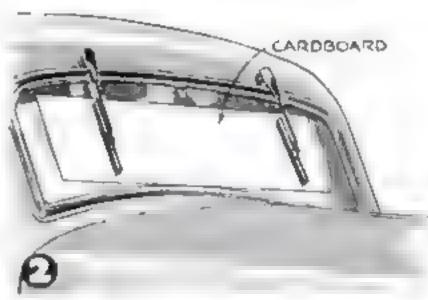

Reep in a car for removing grease from the hands, cleaning the windshield, and similar purposes. Instead of cluttering the glove compartment with the box, cut a rectangular hole in the fiber paneling and secure the box in place with metal clips. If you do not cut the paneling, an extra clip is of course needed under the box.—S. J. D.

2 most and snow on the windshield are a constant nuisance if you have to keep your car outside overnight in the winter. To avoid the bother of having to clean off the glass each morning, put a sheet of cardboard under the wiper blade when you park the car. Use separate sheets on a car having a divided windshield. It's much simpler to pull off the cardboard than to scrape away frozen snow and sleet.—J. J. B.

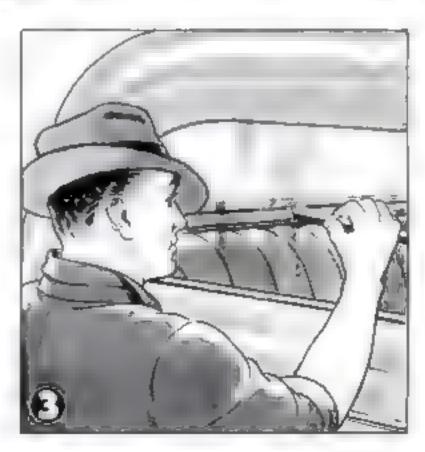

3 cleaning car windows without lint or streaks is easy if you unhook the blade from the windshield-wiper arm and use it as a squeegee to remove the excess water. Most wiper blades can be readily disconnected without tools. One advantage of this method is that you always know where you can find the squeegee.—W. E. B.

4 LOCATING A LEAK in a gas line, a manifold-vacuum line, or other metal or rubber tubing is sometimes difficult to do visually or by the sound of air hissing out. However, if you block one end and blow a puff of to-bacco smoke into the other, it's simple to spot where the trouble lies.—H. W. S.

#### ON THE GADGET FRONT

by the famous Bing and his brother Larry (see P.S.M., Dec. '43, p. 85) has developed the gadgets below for commercial production. Some are made of noncritical material and will reach store counters soon; others are made of metal and cannot now be manufactured in quantity, but will be distributed as soon as restrictions on critical materials are eased.

THESE SUNGLASSES, unlike most, have no dark lenses, instead, translucent shades are used to diffuse light from above. Thus the frames may be used for regular lenses, if the wearer requires them, or may be left empty, if one has perfect or good eyesight

ANY PIPE SMOKER will like the device that is shown at the left, It consists of an electric motor and bellows, and is used for breaking in pipes and cleaning them. By adjusting a knob, the machine can be made to alternately blow and suck, for breaking in, or to suck steadily, for cleaning. During the latter operation a chemical is put in the pipe to loosen the cate, and the sludge is sucked into a pad

SELF-LOCKING PLIERS that have compound action and grip firmly even when no pressure is applied to the handles, are shown in use above. They are handy for tightening small nuts

SOAP IS CONSERVED if rested on edge in this portable wall brocket. It is made of plastic and is firmly held, by means of a suction cup, to any smooth surface. The uptitted soap drains and dries speedily because there is no water-entropping dish beneath it

FOR STUBBORN SCREWS, a ratchet device has been attached to a screwdriver, as shown at the right. It is used to increase leverage and is fabricated from cold-rolled spring steel. When not in use, it folds up alongside the handle

PLASTIC-IMPREGNATED LINOLEUM that the home owner can readily lay without help is self-sealed against dirt. Cleaning is a matter of wiping regularly with a damp cloth, mopping occasionally with warm water and mild soap, and every three months applying liquid self-polishing wax. An instruction booklet put out by the manufacturer, The Paraffine Companies, Inc., of San Francisco, is good to obtain if you plan to do the laying yourself. It gives such detailed information as making a paste spreader from a 5" by 12" scrap of the linoleum itself.

FOAM PLASTIC, lighter in weight and lower in heat conductivity than rock wool, glass, and cork, has been developed by General Electric Co. at its plastics laboratory at Pittsfield, Mass., for a secret war use. It holds promise of many peacetime applications, especially in the field of home and commercial insulation. A 2½" by 9½" by 13" block weighs % lb.

Interesting points in its manufacture are

NEW HOSE NOZZIES with a spray control that permits full water flow at any adjustment from fine spray to direct stream have a complete range in just a quarter turn without back pressure to strain the hose. They are made of rustproof, crackproof, and chip-proof acetate by the Plastic Die and Tool Corp., of Los Angeles.

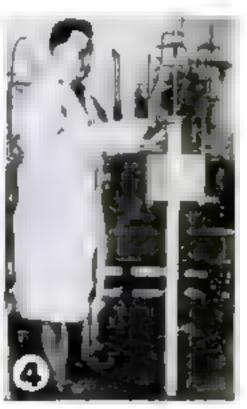

illustrated in the laboratory photos below. A mixture of phenol resin is poured into a beaker (Fig. 1), generates its own heat, and begins to rise in two minutes, as in Fig. 2. Rising at the rate of 1" a second, the column is supported, as in Fig. 3, so it will remain erect. In Fig. 4, the column has reached its full height, and in a few seconds it will have cooled and hardened and the support can be removed.

# MODEL BARRAGE VERNON B. CASE

CHIPS traveling in areas that are subject to enemy air attack often use barrage kites to carry steel cables into the sky. The cables entangle any dive bomber that ventures too close. (See P.S.M., Aug. '44, p. 125.) A full-size kite would be too much for the amateur to build and handle; but here is a model with a four-foot wing spread that has enough lift to provide thrills aplenty.

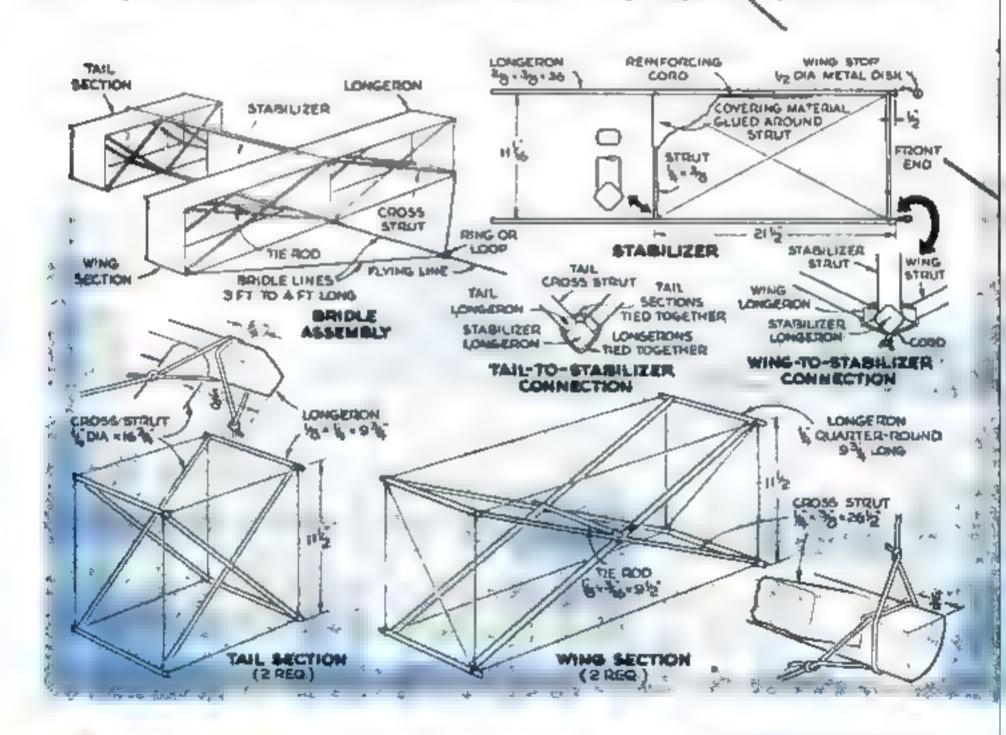

The frame—that is, the struts, longerons, and tie rods-is made of white pine. The covering material is tissue paper or thin musiin (organdy).

Each wing section consists of four cross struts, four longerons, and one tie rod. Mark the mid-points of these struts and fasten

#### Exciting Fun Is Yours with This

them together in pairs, using small nails and bending the ends over as shown in Fig. 1. Spread these pairs slightly to form X's and fasten the longerons to the notched ends with glue and small nails, as indicated in Fig. 2. An excellent adhesive for this purpose is model-airplane cement, or any similar quick-drying preparation, but you can use casein glue if you allow sufficient time for it to dry. Secure the tie rods in place with cord seizing or heavy rubber bands.

Next make the looped-end cords that hold the struts rigidly in position. Each wing section requires four horizontal, four vertical, and two diagonal lines. Use a light, strong cord. Brown waxed store string is too weak. Lightweight chalk line is acceptable, but 12 to 16-lb. fishing line is ideal. To make all the vertical lines uniform in length. use a jig consisting of two finishing nails and a board. Drive the two nails into the board so they are 11%" apart. The a bowline in one end of a piece of cord, leaving a loop about 1" long. Slip this loop over one nail.

# KITE IS LIVELY FLIER

#### Copy of the Kites That Guard Freighters Against Bomber Attack

Pull the cord taut and double it back around the other nail, as in Fig. 3. Holding the doubled portion firmly, slip the cord off the nail and tie a bowline to form a loop like the first one. By varying the distance between the nails, you can similarly form the horizontal and diagonal ties.

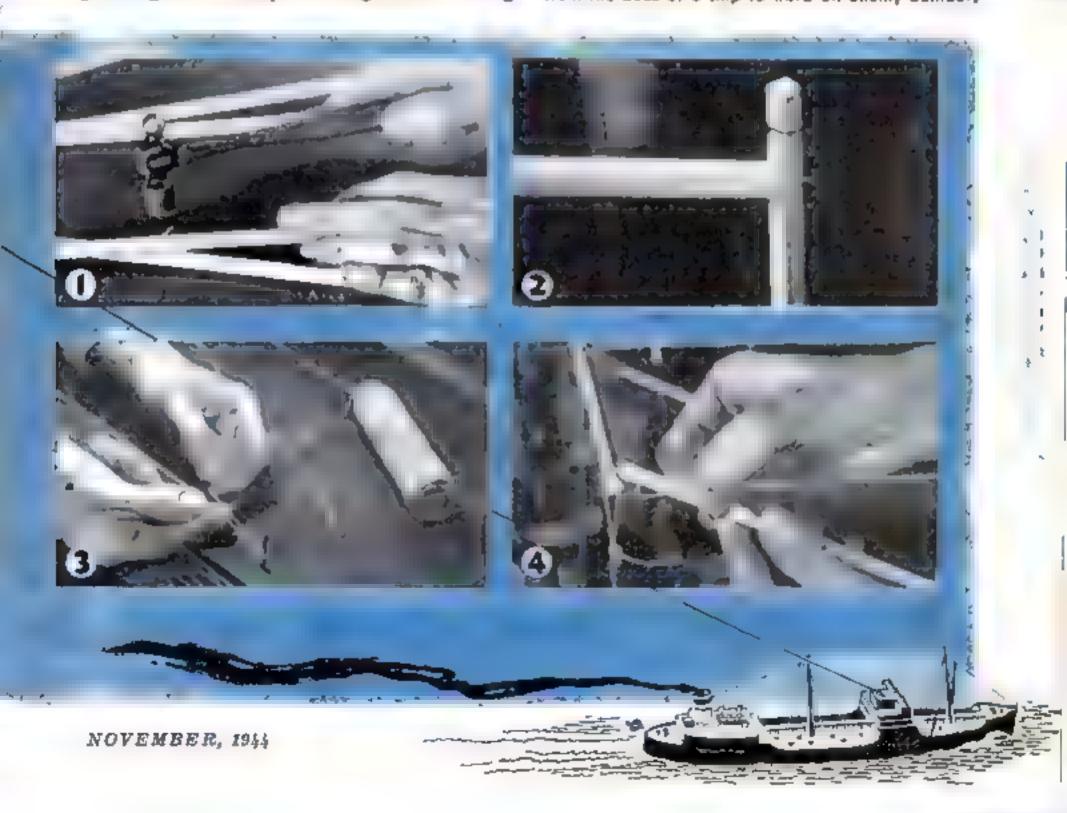

Make shallow notches near the ends of the longerons to hold the cords. Slip each cord over the proper longerons, as in Fig. 4, and secure it with a touch of glue. A completed wing section, ready for covering, is shown in Fig. 5.

The two tail sections are assembled in the same manner as the wing sections except that there are no diagonal cords or wooden tie rods. An assembled tail-section frame is shown in Fig. 6.

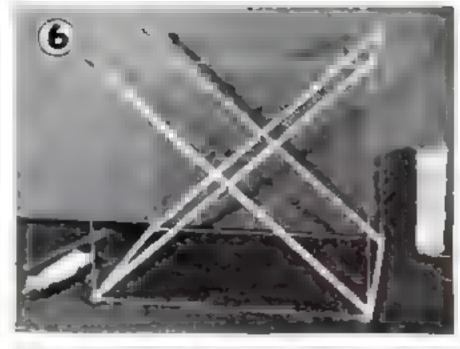

To tie the wings and the tails together, make a stabilizer section. It consists of two longerons and two vertical struts. Crossed diagonal cords stiffen the frame. Nail a small metal disk to the front end of the upper longeron to keep the wings from moving

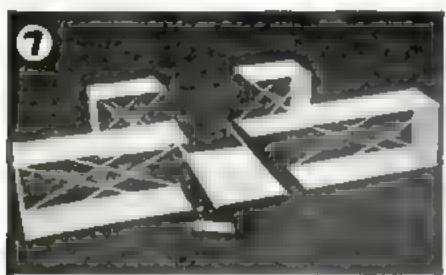

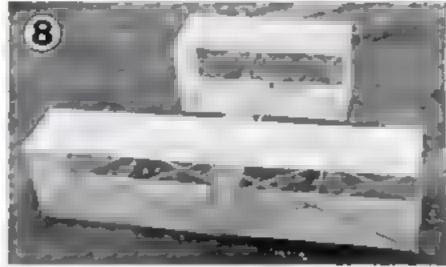

Above, how soilors launch a full-size barrage kite from the deck of a ship to word off enemy bombers

When the wings are put in place, the wing longerons will rest against the stabilizer longerons with the front vertical strut holding them slightly apart. Small brads driven into the stabilizer longerons serve similarly to space the trailing edges of the wings. Additional brads act as stops to prevent the wings from slipping back along the sta-

Cover the top, the bottom, and one end of each wing and each tail, and the portion of the stabilizer between the vertical struts, with paper or muslin. Cut the covering material '4" wider than the space it is to occupy. To cover the wings and tails, fold the edges of the covering material around the cords and secure them with glue; then glue the covers to the longerons. To cover the stabilizer, run lengths of reinforcing cord between the two tops and between the two bottoms of the vertical atruta; then glue the cover to the cords and to the struts. If you use tissue paper, you can strengthen it now by applying a coat of linoleum lacquer to it. The kite should then look as shown in Fig. 7, and is ready for assembly.

Punch small holes in the covers 1\%" from the ends of the wing and tail longerons that butt against the stabilizer and reinforce them with glue or lacquer. Through these holes go 12 cords to bind the kite together. Four are used to fasten the tail sections to each other; four more pass through the same holes and tie the tails to the sta-

bilizer; and the remaining four are used to hold the wings to the stabilizer. The assembled kite will look like Fig. 8. It may be disassembled for storage or transportation by cutting away the 12 cords just mentioned.

At the front end of the lower stabilizer longeron and each outer, lower wing longeron attach a small wire or cord loop to take the ends of three bridle lines. These lines come together about 3' in front of the kite, where they are tied to a ring or a loop. The kite line is also tied to this ring or loop, or it may be fastened with a small snap book.

The kite is now ready to be flown. Wait for a fairly breezy day. Stay well away from woods or other obstacles that might cause gusty air currents. Let out about 50' of cord and have an assistant hold the kite at head level, pointing it upward at an angle of about 45 deg. Hold the line moderately taut. When the breeze is good, take a short run. The kits should rise immediately and continue to climb as you pay out line. If it rides on too even a keel, it may overrun you and go into a dive. To remedy this, add weight to the tail, an ounce at a time, in the form of lead sinkers or blocks of wood that are held in place by string. The kite illustrated showed a pull estimated at 10 to 15 lb. during the test flight, which was made in a fairly stiff breeze.

It is a good idea on flight expeditions to take along some spare covering material, cord, and quick-drying cement for making emergency repairs.

billzer.

# What Conford Cardboard? \$50 CONTEST

Cash Awards for the Best Entries

AVE you ever tried working with cardboard? It can be a fascinating hobby, and you may be surprised by the useful, attractive, and remarkably gturdy articles you can make. To stimulate interest in cardboard projects, POPULAR SCIENCE MONTHLY is offering \$50 in cash prizes for the best eight articles made from cardboard. The awards will be as follows.

First Prize . . Second Prize . . . . Third Prize Five Prizes . . . . . \$1 each

Entries will be judged on design, originality, and craftsmanship. No material other than cardboard will be allowed. but any kind of fastener may be used. In case of ties, each tying contestant will be awarded the prize for which he is District.

Only one entry will be considered from each contestant. Pack yours carefully and mail or express it to the Cardboard Contest Editor, Popular MONTHLY, 353 Fourth Avenue, New York 10, N.Y., to arrive on or before January 15, 1945. The article itself must be submitted, not a photograph. No entry will be returned. Judges will be the sditors of this magazine, and their decision will be final. The contest is open to all except employees of this publication.

In cutting cardboard, use a sharp knife or razor blade with a metal-edged ruler as a guide. Make several light strokes rather than a single heavy stroke. Cor-

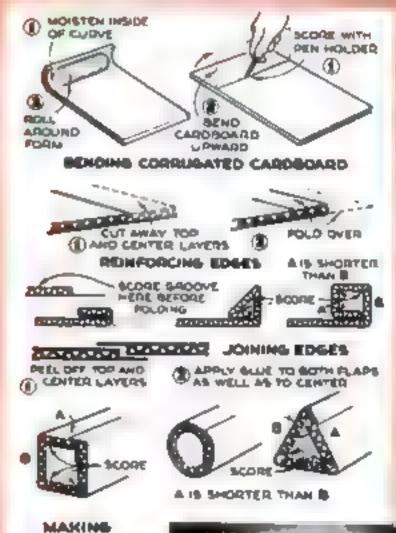

rugated cardboard can be bent by first scoring it with several firm strokes of a rounded point, such as the tip of a penholder, while using a ruler az a guide. Take care not to cut into the material. Bend along the scored line. When marking measurements, bear in mind that the inside dimension at a bend will be diminished and the outside somewhat increased. For rounded bends,

Many projects such as this stardy table and the vase can be made of cardboard. Study these; then create your own designs

moisten the inside of the curve and bend gradually in line with the corrugations, using a cylinder as a guide.

Several methods of joining and edging are shown in the drawings. Rolled and triangular edges add strength. thicknesses glued together with the corrugations at 90 deg. make a sturdy piece.

For a finish, try show-card colors coated with clear lacquer or varnish.

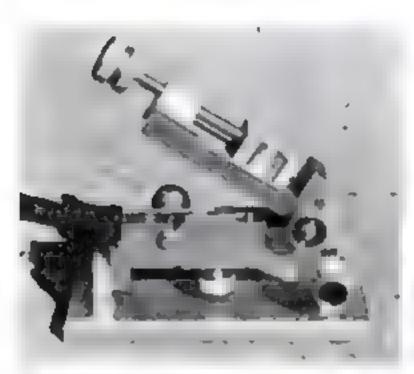

# CRAFTSMEN AT WORK

MAKING LEAF SILHOUETTES is the hobby of Dr. Adrian Lewis, a professor at Manhattan College, New York City. His painstaking technique involves using sharp-pointed instruments to scrape away the leaf's surface to the depth required for the desired shading effect. The scene below depicts Boston College at night.

PRECISION-BUILT of cold-rolled steel by Pfc. Anton M. Ryzak, this tool-maker's vise rotates through 360 deg, tilts 180 deg., and can be elevated as much as 45 deg. Handwheels are provided to lock it in any position. It is used for laying out work and for compound-angle grinding.

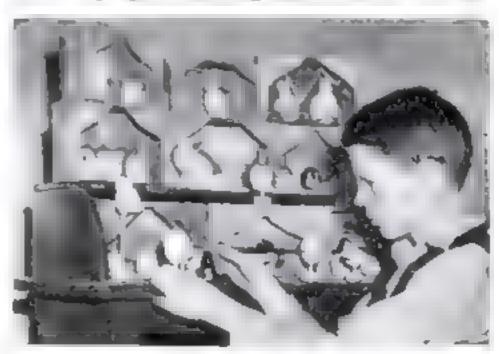

THIS MODEL ROCKET PLANE was built by Duke Fox, of Los Angeles. Here he is preparing to light the rocket fuse for a flight,

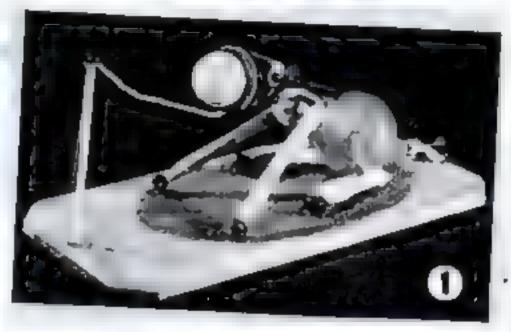

OPERA STAR Herta Glaz is an amateur woodworker. In her spare time, she builds furniture for servicemen's recreation rooms,

# BIZABRE ANIMALS WIN PRIZES

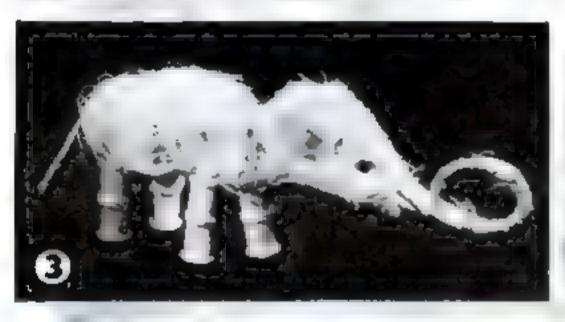

CTEP this way to the big tent! See the goofy animais, rampant after their struggles on the political battlefields! Conceived in the imagination of P.S.M. readers and born of materials from wastebasket and workshop. these fresk fauna are the top winners in our recent \$100.00 contest for the best Republican elephant and the best Democratic donkey made from odds and ends. A full list of the winners appears below.

#### BEST REPUBLICAN ELEPHANT

1st Prize: O. I. Price, Jr., Frederick, Md. 2nd Prize: Harry Beeler, Hollywood, Calif. 3rd Prize: Miss Halpin Abbott, Dallas, Tex. 4th to 8th; J. H. Madison, West Hartford, Conn., Pvt. Baker Hendershot, Selma, Ala., Ruth Walker, Hicksville, N. Y.; S. F. Sicko, Holyoke, Mass.; Bill Insley, Indianapolis.

#### BEST DEMOCRATIC DONKEY

1st Prize: E. B. Kostek, Chicopes, Mass. 2nd Prize: H. O Henderson, Phillips, Tex. 3rd Prize: Mrs. Roy Clark, Wichita, Kan. 4th to 1th Nelson Valade, Providence, R. I.; J. C. Lamons, Knoxville, Tenn; Mrs. Goldia Wooten, Norton, Kan.; L. J. Bowers, San Diego, Calif.; C. D. Ingram, Dallas, Tex.

# Nautical Book Ends for the Armchair Mariner

#### By JOHN J. GALLIVAN

HE ACRID aroma of blackpowder smoke and the
screaming sound of a broadside of round shot are vividly
suggested to ship lovers by these
early naval cannon. Mounted
on weighted book ends, they will
make an attractive addition to
almost any living room or den.

Turn the barrels in a lathe, using brass, mild steel, or wood. Drill two 4" holes in each—one laterally through the barrel to take the trunnion peg, which should be a drive fit because in the original it was cast as an integral part of the barrel; and one in the outboard end, 2" deep, to simulate the bore.

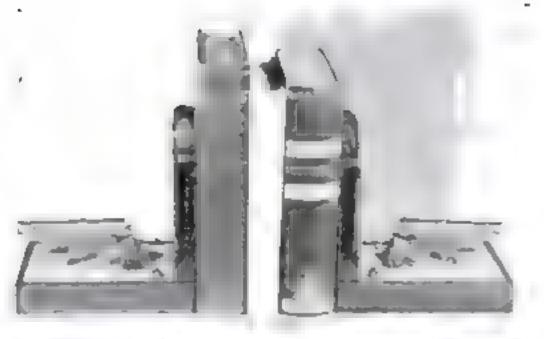

Build the carriages, or trucks, from 3/16" stock, with the exception of the rear filler blocks, which are made of 5/16" material. Apply glue to the joints and set the assemblies in clamps until they are thoroughly dry.

Cut the eight wheels from %" hardwood doweling and fit them on the turned ends of the 3/16" by 3/16" by 2%" axies. Glue lead-foil edging on the car-

riages and on the rims of the wheels. Finish the woodwork with red mahogany stain, wiping it off immediately after applying it to give a light honey color. Set the barrels in place and apply lacquer to both completed assemblies.

You may purchase ringbolts and blocks ready-made or, if you prefer, you can make your own. Use paper-clip wire for the rings and fabricate the blocks from 3/16" by 5/16" stock, as shown. Paper-clip wire is also suitable for the straps.

Make the decks and the bottoms of the book-end bases of 3/16" plywood. Rule in the deck seams with a drafting pen and fin-

Quoins, or elevating wedges, were used on early cannon such as these to adjust the trajectory of the round cannon shot

ish the decks with several coats of varnish or lacquer

Fasten the cannon-and-carriage assemblies to the decks by drilling two small holes through the decking directly under each trunnion pin, about 1/4" apart, and passing a light wire under each barrel in front of the trunnion; then over the trunnion each side of the barrel; then down through the holes. Put a small scrap of sheet metal between the holes on the underside of each deck and tighten each wire by twisting the ends together.

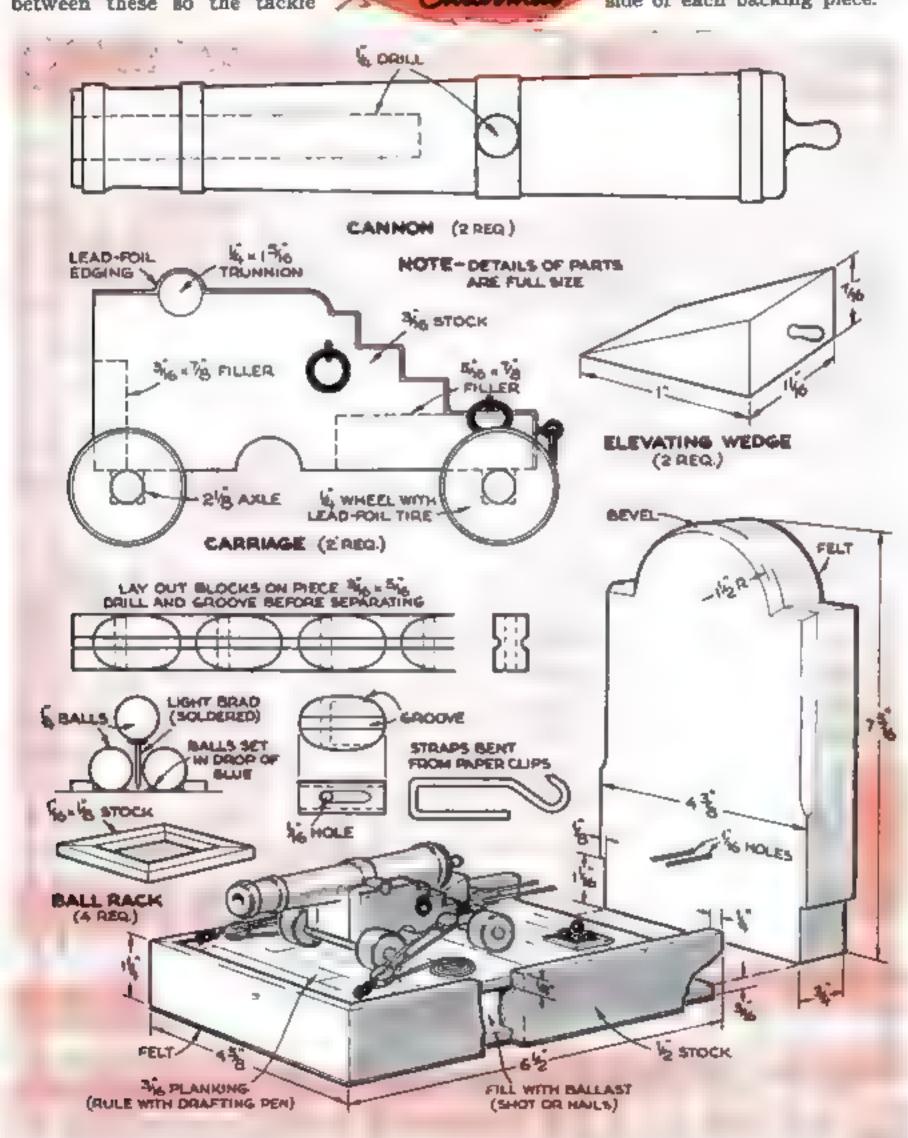

Use mahogany or other suitable cabinet wood for the sides of the bases and the back

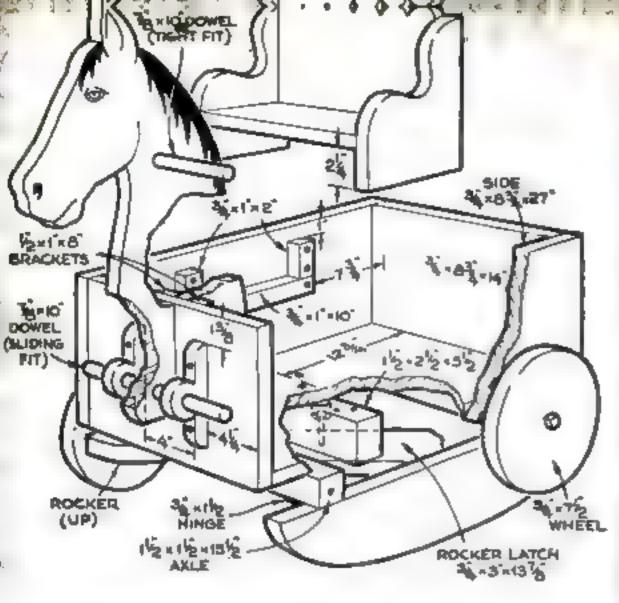

pieces. Rabbet the sides and shape and bevel the backs, as shown. To assemble, use glue and light finishing nails.

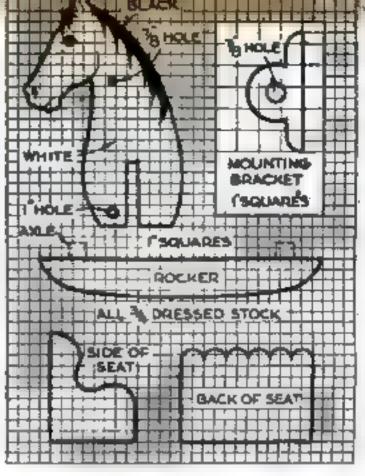

Since weight is important in book ends, fill the hollows in the bases with ballast. This may be in the form of brads, shot, or linotype leads. Fix it in place by pouring melted wax over it.

Drill two rigging holes in each back; then cut a groove between these so the tackle line will not cause a lump under the felt backing. Each book end has one withdrawing-tackle and two side-tackle assemblies, which are rigged as shown in the lower right-hand drawing. A spot of glue here and there will serve to keep the blocks and rigging in the proper place.

Cannon balls are ball bearings set in racks. Glue felt under the base and to the inside of each backing piece.

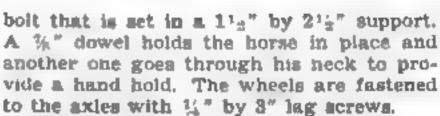

#### Combination Wagon and Hobbyhorse Is Two-in-One Toy for Youngsters

ITH the rockers folded up out of the way, this toy is a wagon; with them let down, it becomes a hobbyhorse, Almost any boy or girl from two to

five years old would love to find it waiting under the tree on Christmas morning

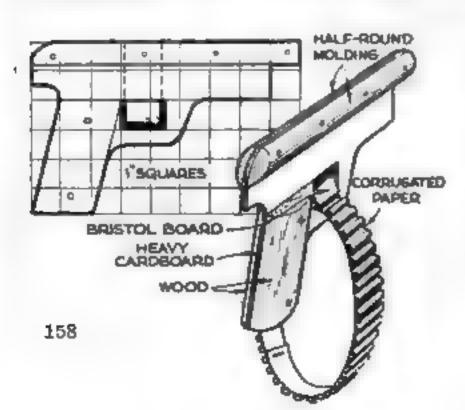

The chief material used is 🐒 dressed stock. From this the box, horse, seat, wheels, rockers, rocker latch, and brackets are made. A power jigsaw is handy when cutting the curved pieces, but hand tools are auflicient if one is not avaitable. The axles are made from 114" by 114" stock. The rocker latch pivots about a carriage

Finish the toy in bright, contrasting colors and name it after the child for whom it is made—for instance, "Roger's Ranger," "Penny's Prancer," "Susan's Sea Biscult," or "Danny's Dobbin."-L. R. TREINIS.

#### Pistol Gives Realistic Machine-Gun Sound Effect Cardboard

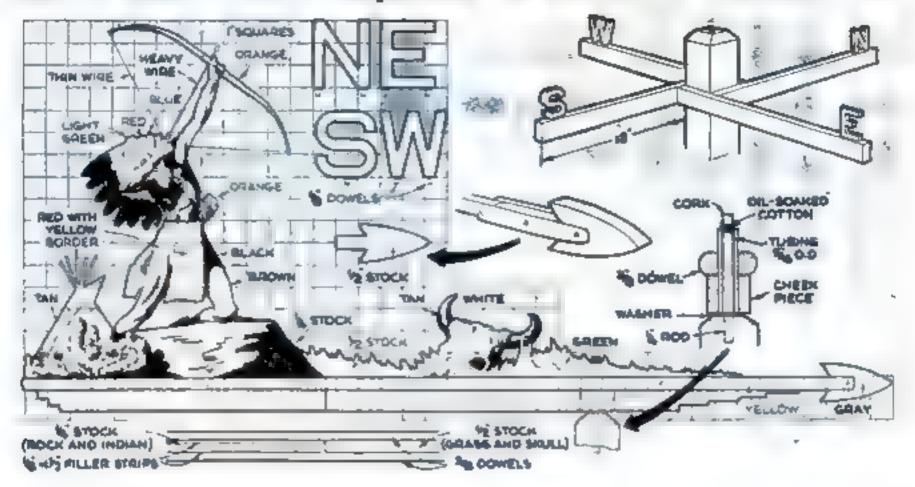

make (IT NOW hustmas

Tills automatic pistol, which can be assembled in a few minutes, is one of those perennial favorites, a noise maker. Two pieces of heavy cardboard form the frame. The clacker may be Bristol board, as suggested, or celluloide The cartridge belt is a length of corrugated paper. Two pieces of balf-round molding make the barrel and two shaped pieces of wood form the grip. After assembling the pistol, staple the ends of the belt together. When it is pulled through the trigger hole, the clacker vibrates, emitting a realistic clatter.

#### Indian Motifs Are Incorporated in Distinctive Weather Vane

IF You treat him well, the Indian chief on this vane will reciprocate by shooting holes in the clouds when your Victory garden needs rain and by frightening the clouds away when you are entertaining outdoors.

The figure, the rock on which it is kneeling, and the sagebrush and tepee behind are jigsawed from 1," stock, preferably plywood. Use 1," material for the grass and

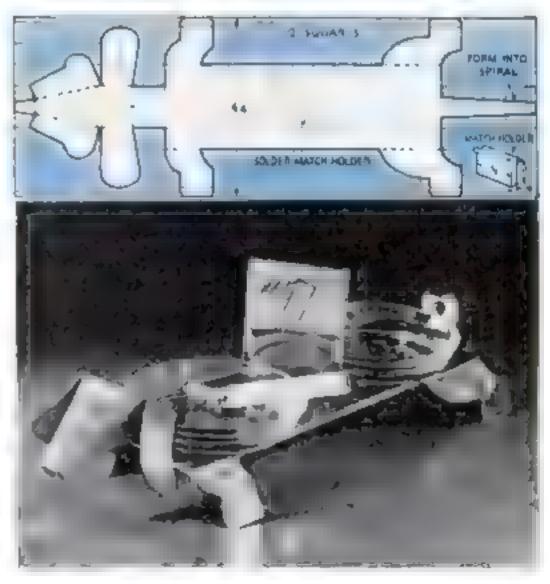

sku!! in the foreground, as well as for the arrowhead at the front of the vane. Two lengths of %" dowel, flattened on one side, extend back from this arrowhead along the vane. Use %" filler strips as shown.

Paint the vane—the colors indicated make an effective combination—and mount it as shown. Cut the arms and letters from \%" stock and nail to the pole.—GRAY WOLF.

#### Decorative Ash-Tray Holder Is Made from a Discarded Tomato Can

This unusual dachshund can be made in an hour or so from a large tomato can. Prepare a pattern on stiff paper, using the drawing as a guide. Cut open and flatten the can, taking care not to dent it. Trace the pattern on the tin and cut it out. Then bend the material as indicated by the dotted lines in the drawing, using a pair of flat-nose pliers and working slowly.

Make the match-packet holder from the top or the bottom of the can. The circular depressions stamped in the can ends may be utilized to add a modern decorative touch. Solder the holder to the back of the dachshund, taking care not to get excess solder where it will show. Polish the project with fine ateel wool and give it a coat of clear lacquer to make it gleam like silver. Small individual glass ash trays may be placed, singly or in nests, on the dachshund each side of the match holder.—C.W.B.

# JIGS ADAPT A SHAPER

Sliding in the groove on a shaper table, the vertical jig is used here in working the side of a cabinet part. The L-shaped section is bolted to a sliding base, and it is adjustable for depth of cut

OUR shaper attachments of exceptional value are a vertical sliding jig, a horizontal sliding jig, a radial arm, and a fluting jig. With them it is possible to do easily tasks that would otherwise require elaborate fixtures or special setups. A fluting jig that can be built in the home workshop is equipped with a dividing head that makes it useful for a variety of work. The radial arm, used with the dividing head and either with or without the vertical jig, is helpful when ornamental carving is to be done.

How is a vertical sliding jig made? This jig is built in three parts, as shown in a

#### By EDWIN M. LOVE

drawing. The L-shaped section is slotted for bolting to a base that slides in the shaper-table groove, and it is adjustable for distance from the cutter, while the vertical face is slotted for holding a fence in either of two positions. Such a jig is useful for grooving drawer sides, cabinets, and the like, and for making end rabbets, stub tenons, and wedge-shaped tenons.

What is a horizontal sliding jiq? A convenient one
is shown in a drawing. The
screw clamp can be cut
from a C-clamp or an old
clothes-wringer clamp. Remove the swivel foot by
bending out one of the ball
tabs and twist the screw
into a center hole in the
hardwood block, thus cutting threads. Replace the
foot and bend the tab back
against the ball of the
screw.

One photo shows such a jig used in continuing on the end of a piece of work a molding that has been cut in the sides. For a mitered end, the gauge head would be swiveled to suit. Similar setups are used for such jobs as tonguing and grooving the ends of hardwood

flooring or cedar-closet lining, and for cutting limited-length stub tenons. The ends of segments of circles can also be worked if the pieces are properly blocked. A backing piece is always needed against the edge the cutter leaves to prevent splintering.

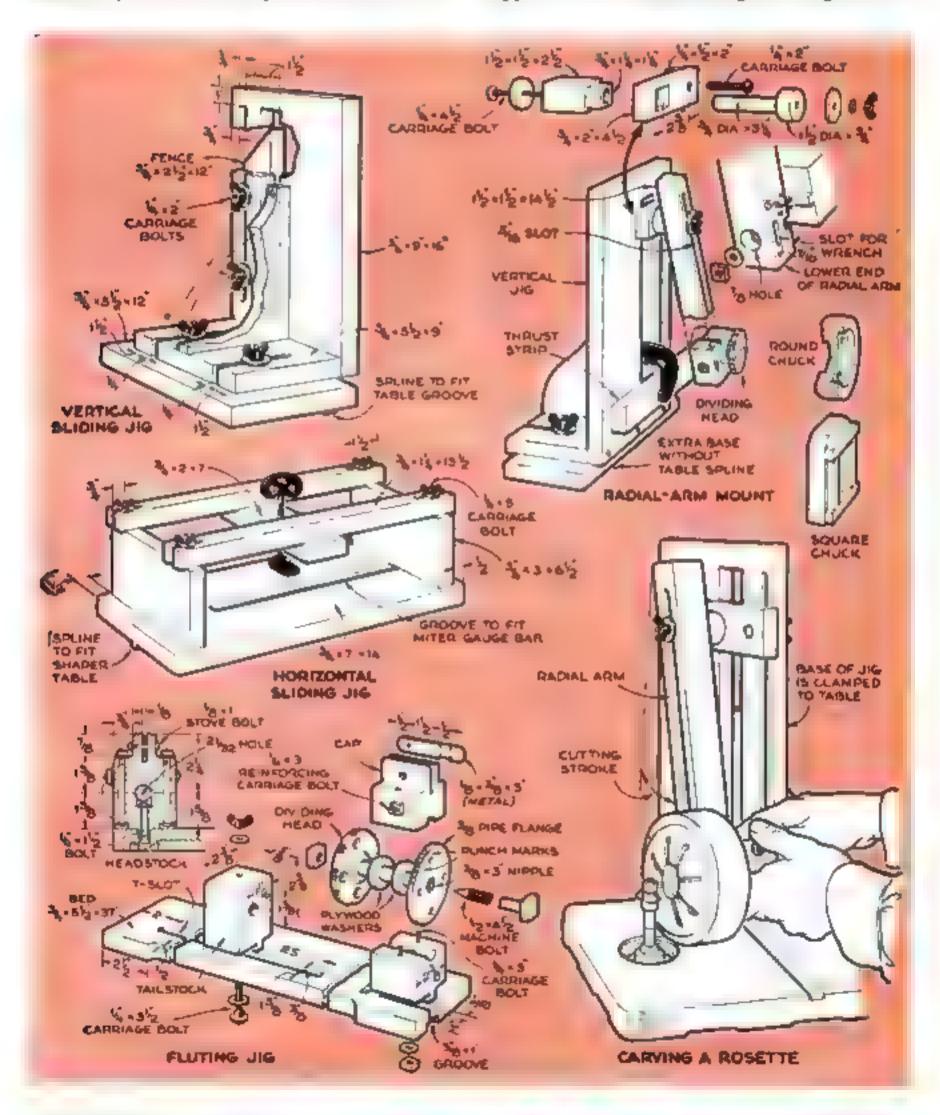

Is a fluting fig difficult to build? Besides the dividing head, the only pieces required are a simple base, an adjustable tailstock, and a removable headstock. The tailstock carries a tapered lathe dead center or a ½" rod on which a cup center can be locked, while the headstock has a pointed bolt for a center or a blunt bolt to which a clamp-on sour center can be attached.

### TO SPECIAL JOBS

Make the dividing head of two pipe flanges and a pipe nipple. To index it, screw one flange on the nipple and mount it on a wooden chuck fitted with a dowel on which the nipple can be centered. File the edges smooth; then, using the lathe indexing attachment, mark off 60 spaces, notch with a

hacksaw, and file the notches V-shaped. Repeat for the other flange, making both seven and eight divisions on it. A paper pattern helps in laying out seven divisions. File the center-bolt point and taper in the lathe.

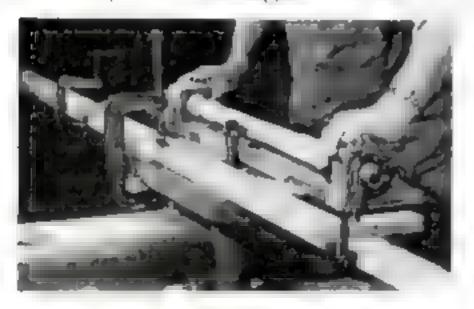

How is the fluting jig used? Clamp the nipple in the headstock tight enough to re-

Molding on the edge of a narrow piece is continued on the end with the old of a harizontal jig fitted with a spline to slide in the shaper-table groove

In fluting a table leg, as shown below, push the jig against the cutter-spindle collar and slide it on the shaper table until stopped at the other end

quire considerable effort to turn it. Be sure to center the center bolt before tightening its nut and to fit the indexing lever anugly into its slot to prevent play.

To flute or bead a table leg, mount it in the jig, tack on the front edge of the base a guide strip shaped to the profile of the part to be enriched, and mount the turning with its square faces in the proper planes. For each flute, push the jig forward until stopped by the spindle collar, cut by sliding the jig lengthwise until stopped, and then draw the jig back.

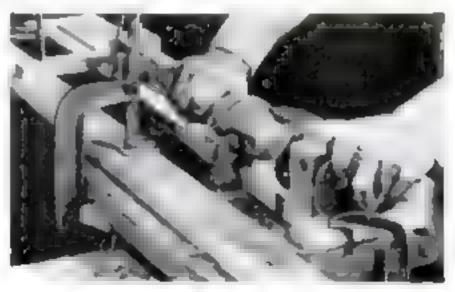

Round work is scallaged with the help of a radial arm clamped to the shaper table. The dividing head spaces the cuts, and a stop black regulates depth

To guide the hacksow in notching a dividing head for a fluting jig, a strip is clamped to the lathe tool rest. The indexing attachment spaces the cuts

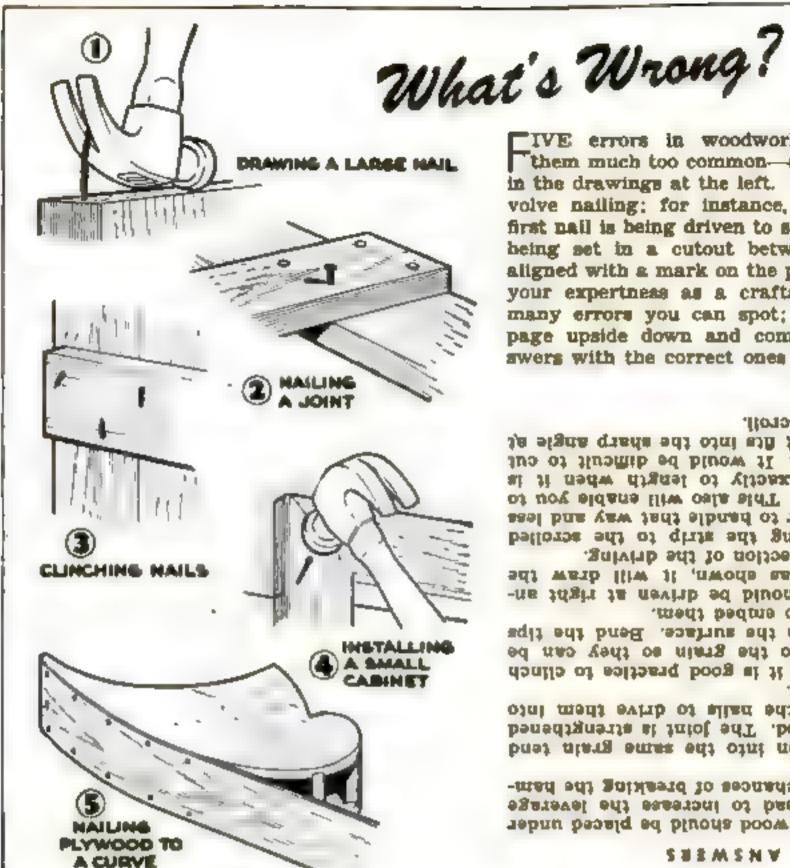

Below, the fluting jig is being used in grooving a table column to house the ends of tripod legs. It can be used with templates to carve cabriole legs

Straight stock can be fashioned into a leg of four or more shaped sides. One template is required for shaping the outer faces of cabriole legs and a second for the inner faces. Inside angles are cut by some other means after shaping

Of what use is the radial arm! Mounted on the vertical sliding jig and fitted with the dividing head, it is used for carving rosettes. Make a chuck to fit the rosette blank, provide it with a back recess for the dividing head, and attach it with flathead stove bolts. On the vertical face of the jig, clamp a thrust strip on which the inner flange of the dividing head can slide, placing the clamp where it will act as a stop. The radius of the cut is regulated by the position of the bearing bolt in the arm slot, while the angle of the cut with relation to the radius of the resette is controlled by the height of the bearing on its support. If the cut is made from the center of the rosette. there must be a turned recess there. It can be filled later with a button.

For scalloping a tray, clamp the radius arm to the shaper table. Tack through a mounting block on the dividing head into the back of the tray. Depth of cut is determined by a stop block which the mounting block or the radius arm will strike.

IVE errors in woodworking some of them much too common-are being made in the drawings at the left. All of them involve nailing; for instance, in Fig. 4 the first nail is being driven to secure a cabinet being set in a cutout between stude and aligned with a mark on the plaster. To test your expertness as a craftsman, see how many errors you can spot; then turn the page upside down and compare your answers with the correct ones given below.

SHEMSNY

#### Rim of Turned Tray Is Enriched by Simple Carving in Shaper

FOR an interesting and serviceable piece that can be decorated in the shaper with the help of jigs shown in the drawings on page 161, turn the tray shown here from a single piece of hardwood 1 % " thick, leaving the bottom unturned for the time being. Recess a backing disk to fit the fluting-jig dividing head, boit it on, and attach the tray with four screws in the waste. Next, mount the radial arm on the vertical sliding jig as indicated in the diagram at the right.

With a beading cutter on the shaper spindle, make 15 pairs of cuts, leaving a space of one notch on the 60-division flange of the dividing head between each pair. Change the cutter for a 1/4" fluting cutter, withdraw the holding screws, twist the blank to center the flute between each pair of cuts, tighten the screws, and finish shaping. Then turn a lathe chuck to hold the top of the tray. and turn the bottom.- E. M. L.

# THE THUNDERBOLT IN MINIATURE

AST, rugged, and heavily gunned, the famous Thunderbolt fighter-bomber is one of the top-ranking American planes. The solid model shown here, made at a scale of ¼" to the foot, is patterned after the latest version which has a new silhouette, 360-deg. visibility for the pilot through an electrically operated bubble canopy, several hundred more horsepower, and increased fuel capacity.

The plans shown at the left are reproduced half size. Connect the ¼" graduations at the edges of the page to form a grid of ¼" squares. Make a full-size working drawing on a large, stiff sheet of paper, laying out a grid of ½" squares and transferring the lines from the small drawing to the large one by matching squares. Then draw a second, similar full-size layout and cut out the shapes to form full-size patterns.

Use a 14, "by 17%" by 84%" piece of stock for the fuselage. Baisa is ideal material to work with, but pine or some other soft wood may be substituted. Cut the block first to the shape shown in the profile, then to that indicated in the plan view. Carve and sand it until it agrees with the fuselage-section patterns. Make the bubble canopy from scrap material and cement it in position. Cut a slot through the belly, from one side to the other, to take the one-piece wing

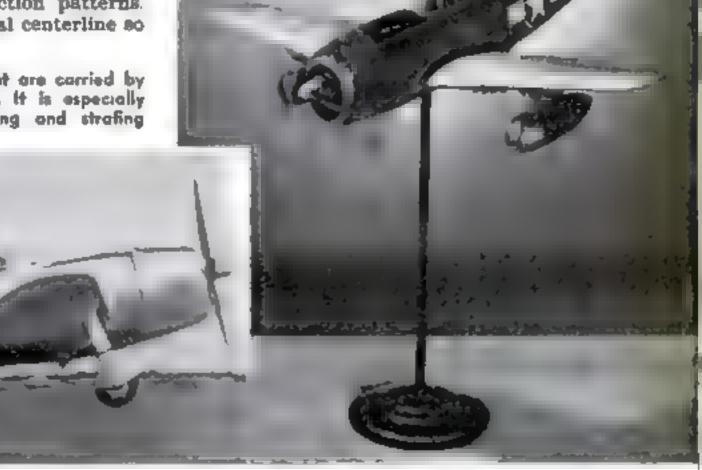

Make the wing from a 1/4" by 21/4" by 10 1/4" blank. Shape it to conform with the top-view outline; then taper it toward the ends to agree with the front elevation, and finally carve and sand it to the form that is indicated by the wing-section patterns. Crack it along the longitudinal centerline so

Bamb loads up to a ton in weight are carried by the full-size plane, shown below. It is especially effective for low-altitude bombing and strating the tips can be elevated to the proper dihedral. Rest one half flat on the bench, weight it in place, raise the tip of the other half 1\%", support the raised tip with a block, and cement the cracked center.

The stabilizers and the rudder are fabricated from %" stock. Saw them to the profiles shown, taper them slightly toward the tips, and carve and sand them to a streamlined cross section.

Sand each part thoroughly before assembling the model. Use glue or cellulose cement to hold it together. Form the fillets where the after edge of the wing meets the body with plastic composition wood. The two droppable auxiliary fuel tanks and their brackets are next made and secured in place. Cut the propeller disk from celluloid. The stand is bought at a model supply house or made of a turned base and a dowel,

Treat the model with several coats of wood filler, sanding between coats. Paint the entire surface silver with black trim, using a good grade of model-airplane dope. The insignia may be purchased in the form of decalcomanias and transferred to the model.—Bitt Sprague.

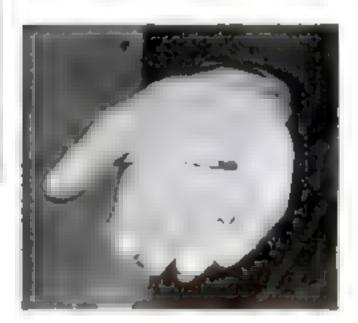

27646.

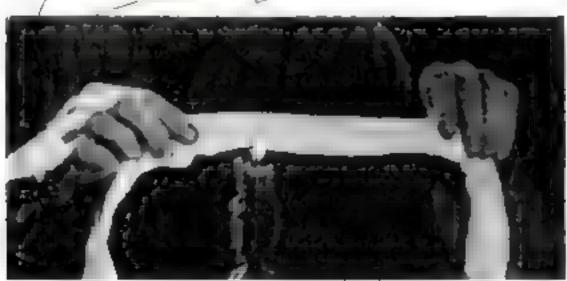

TOUCH THE TIPS of two pencils held almost at arm's length. Easy, isn't it? Now try it with one eye closed. The result may surprise you! To make the test purely one of vision, drop your arms out of position between each attempt. The reason this simple trick is hard for most people is because we owe our ability to judge depth and distance to the fact that our eyes see an object from slightly different angles. Trained on one object, they act like a range finder.

pencils held sy, isn't it? ed. The remake the drop your an each atple trick is use we owe ad distance e an object a. Trained is a range

CLOSE YOUR HAND over a page.

ctose your HAND over a paper match, open it, and the match will seem to have turned end for end—that is, if you have prepared a match beforehand by splitting it and reversing and gluing the halves so a head appears at both ends'

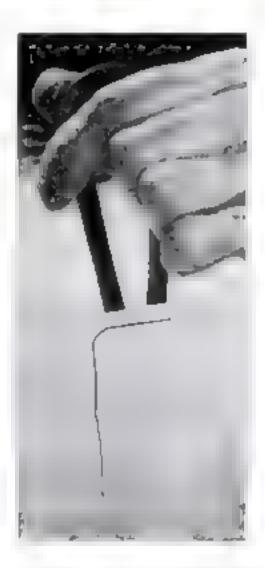

DRAWING A HANDKERCHIEF THROUGH FLAME is a feat to startle your friends! Roll the cloth tight and, starting at one end, draw it slowly and steadily through a candle or match flame. Don't hesitate, or it may burn. Better still, soak it in borax or alum beforehand.

MAGIC ASHES from a paper containing a friend's initials will reproduce those initials on the palm of your hand! Prepare the initials on your hand with soap ahead of time. They won't show. Then burn the paper your friend has written on, and rub the ashes in your palm. They'll stick on the soaped lines.

STEADINESS can be tested amusingly with a paper clip and a small horseshoe magnet, Bend the clip as shown at right, hold it upright on the table with one hand, and bring the magnet near it-not quite to itwith the other. The test is to hold the magnet just close enough for the clip to remain upright when released, but not so close that it will be drawn to the magnet! If your hand is steady, the clip will remain motionless. To make the test really difficult, don't support your elbow on the table when you try it.

# French Provincial Armchair

#### By NORBERT ENGELS

OR those with an interest in furniture with a historical back-ground, this quaint French Provincial chair should have particular appeal. Its prototype was discovered by my wife and me several years ago on exhibition in the Quebec Public Library, to which it had made its way from the famous Hotel Dieu that was founded by Bishop Laval.

It was not very much later that we had the good fortune to discover a chair which proved to be exactly like it in a near-by junk shop. The chair proved on

inspection to be so dispidated and old, however, that only the arms and one back slat could be salvaged; all the rest had to be rebuilt.

Our original chair was made of birch, maple, and oak—fairly good evidence that it was built of odds and ends by some local and more nearly contemporary worker, not in France as was its aristocratic counterpart from the Hotel Dieu. Its seat was upholstered in leather, and its frame was covered by many coats of dark varnish. We

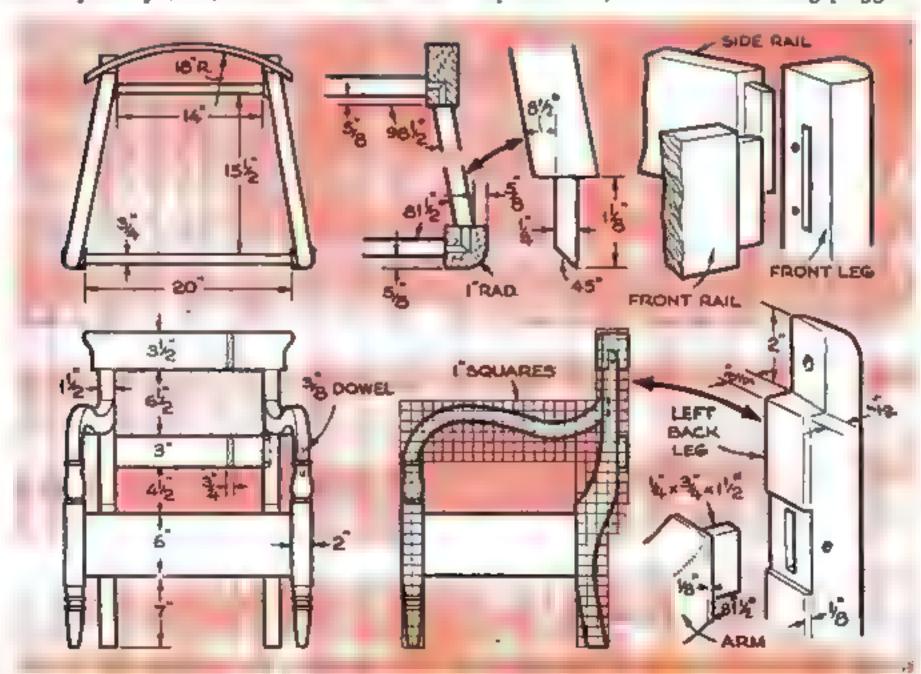

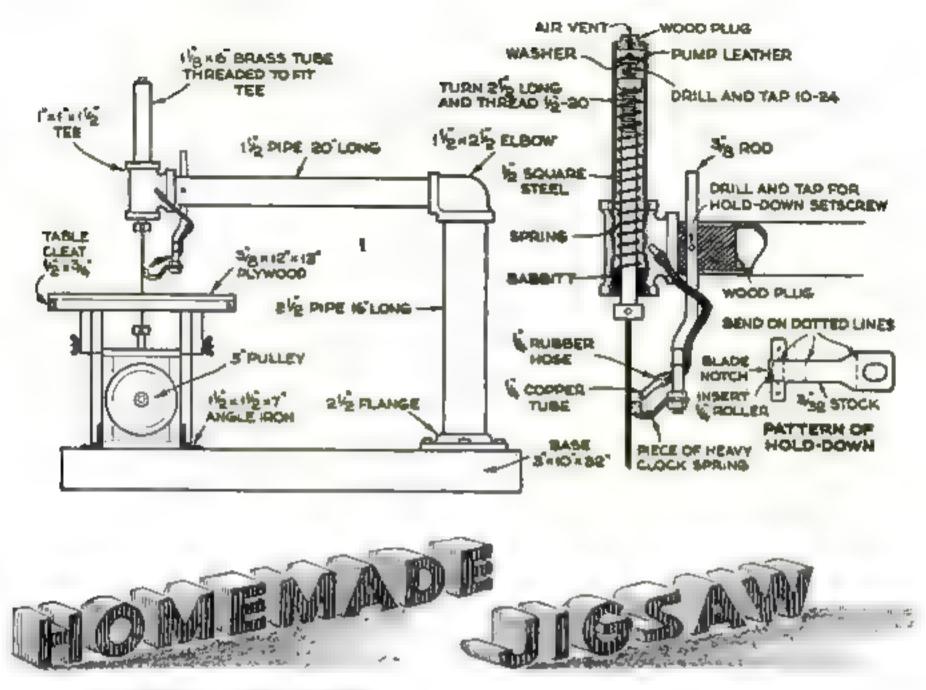

painted our rebuilt chair and a companion piece that we also built in ivory, antiqued it with a slightly browniah cast, added a decal flower design to the top back slat, and put a down cushion on built-in springs. Box aprings without the cushion would be just as suitable. Birch or maple is excellent wood for the construction of a new chair.

A bandsaw will speed sawing out the shaped profiles of the back posts and

the curved arms and two curved back slats. The only turnings called for are the top and bottom sections of the front legs. Keep the center section square except at the front outer corner which is rounded as shown.

Joints, for the most part, are mortises and tenons locked with 3/16" dowels. Note that the tenons of the seat rails meet in the leg mortises and are mitered, and note also the angle the tenons make with the side rails. A screw through each back post holds the top back rail, the screw hole being plugged.

By PETER A. VAN HOFF

OR cutting intricate patterns in wood, plastic, and thin metal, a jigsaw is extremely useful. Often, in fact, it's the most valuable power tool in the home workshop, being suited to a variety of additional jobs such as general sawing, cutting dovetails, tenons, and flutes, as well as such other work as light filing and sanding.

For all its versatility, the jigsaw isn't a hard tool to build. The one shown, constructed of materials that were either in the shop scrap pile or were readily obtainable, required no special tools or skills; a little welding was used, but it might have been dispensed with. The result is a jigsaw that, with a ¼-hp, motor, will cut hardwood up to 2½" thick. It has a 21½" capacity (it could have been more) and a ¾" stroke. While this may seem a short stroke, the writer's experience is that a longer one may increase vibration undesirably.

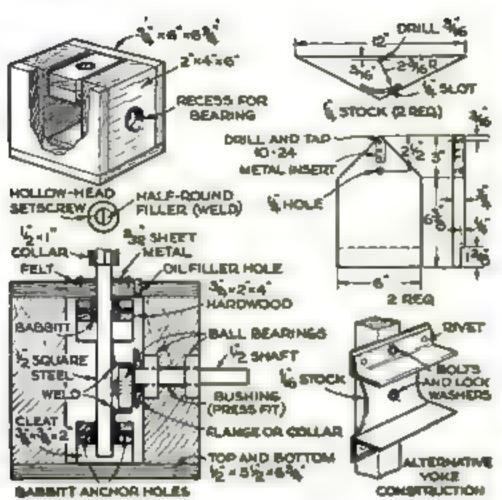

As shown in the drawings, the crankcase is a sturdy hardwood box that is entirely separate from the table supports that straddle it. This box has two 2" by 4" by 6" sides, one of which is bored for the drive-shaft and counterbored for the generator ball bearings that the shaft runs in.

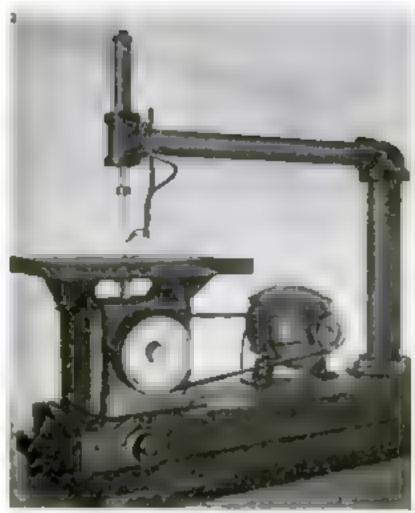

Inside the crankcase two %" by 2" by 4" wooden blocks are mounted horizontally on

cleats to hold the babbitt bearings of the lower plunger. The bearings were cast in the blocks; a 1" hole was bored in each block and smaller holes were drilled from the edges to this central hole to help anchor the babbitt. Then the plunger, a 9½" piece of ½" square steel stock that was originally a baby-carriage axle, was thrust in a can of sand, the bearing block laid on top of the sand, and babbitt poured in.

The %" crankshaft turns in a bushing that was a push fit on the shaft and that was filed to a push fit in the ball bearings. At its inboard end a flange from a motor coupling was driven on (a machined pipe flange or a %" collar might have been used), and a hole %" off center was drilled in the coupling. This is tapped for a 5/16" cap screw that runs through a bushing filed for a press fit in a third or crankpin ball bearing. It may be necessary to file the head of this cap screw to obtain ample clearance.

Two pieces of angle stock, %" by %" by 1", were welded to the plunger above and below this bearing. They were clamped in position, checked for squareness and for a tight fit against the bearing race, and then pinned to the plunger with small nails so as to hold position during welding. Afterward the angle pieces were filed to a free

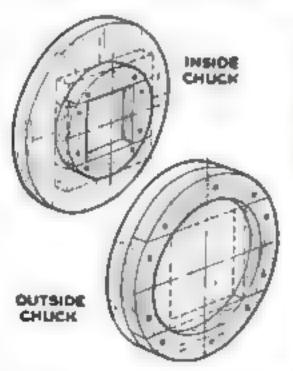

sliding fit on the bearing. If you wish to avoid welding, an alternative method shown in the drawings uses a gusset and bolts.

The sides of the crankcase were assembled with the shaft and plunger in place, and the drive was given a trial run to test for balance and free action, after which the top and bottom were added. A gasket cement was used on all crankcase joints, since the unit operates half full of light motor oil.

The bearing for the upper plunger was cast by setting the tee in a can of sand, centering the plunger carefully in the tee, and pouring in babbitt to a depth of 1".

This plunger, of the same stock as the lower one, was rounded with a file for the upper 2½" of its 11" length and then threaded ½"-20 for the spring-retaining nut. Before the tee was screwed on, a wooden plug was driven into the pipe arm to improve the efficiency of the sawdust blower. Each of the blade vises on the plungers was made by cutting away half the shaft to a distance ½" from the end and by filing the remaining stub to a half-round shape. A ½" shaft collar, fitted with a hollow-head setscrew facing a half-round filler welded or soldered in, completed the blade vise.

#### CHUCKS FOR BIG TURNINGS [WOODWORKING]

A ging that is to be turned on both sides and edges such as the fellow of a spinning wheel, cannot be field in the lathe with screws but must be chucked. To do this, first mount a disk of five-ply stock on the faceplate with screws. Face off and turn the outside true; then screw on outside cleats, butting them against one another and placing all screws well outside the diameter of the work to be held. Turn the inside edges of these cleats to a anug fit for the outside of the bandsawed fellow, and turn the outside of the chuck true for balance, as shown in the lower drawing at the left.

Press in the fellog and turn the inside and one face; then pry it out, reverse it in the chuck, and turn the

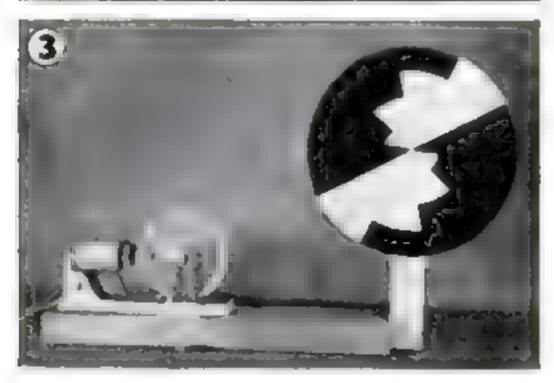

other face.
To turn the outside of the ring, remove the cleats from the chuck and screw in place a second set of cleats as shown in the upper drawing at the left. Turn the outer contour to a snug fit for the turned inside rim of the felloe and force this on to finish turning the outside edge. If either chuck is accidentally turned down too far, and thus holds the work loosely, it can be built up by pasting a strip of paper around the undersized edge.

POPULAR SCIENCE MONTHLY SHOP DATA

#### STROBOSCOPE STOPS MOTION

EARS, automobile wheels, spinning saw blades, and other moving objects can be made to appear to stand still or even to run backwards with the aid of a simple stroboscope consisting of a small electric motor with a slotted disk on its shaft.

Any small universal motor may be used, but it must be connected in series with a rheostat that will permit smooth regulation of speed at all stages from the slowest to the fastest, for it is on the ability of the stroboscope to match the speed of the object being examined that the success of the device hinges. An ordinary sewing-machine motor and its control were used for the stroboscope shown in the photo at the upper right on the facing page. If you lack such a control, a water rheostat made like that at the bottom of the same page will serve admirably.

Mount the motor on any convenient stand that will keep the stroboscopic disk from fouling as it revolves. The stand shown has an upright so shaped that it can conveniently be held in one hand when desired.

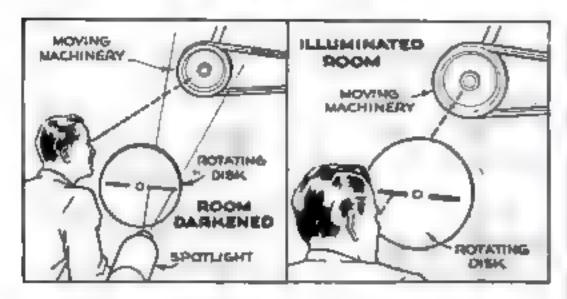

Cardboard or any light metal may be used for the disk, which should be about 7" in diameter. It is drilled at the center to fit over the motor shaft or a shoulder on the end of an adapter, and is provided with one or more slots. The disk shown has two diametrically opposite slots and works satisfactorily, though one with only one slot proved in comparative tests to give better images and to be easier to control. Bolt the disk to a pulley fitted on the motor shaft or to the face of an adapter if you have a lathe in which to make one.

How the stroboscope stops motion is illustrated at left in the photos of a black-and-white cardboard disk turned by an electric engine. The device is motionless in Fig. 1; in Fig. 2, taken through the stroboscope, the turning disk is blurred but the engine armature is "frozen"; and in Fig. 3 the disk is in synchronism and appears stopped, while the armature is again blurred.

Scores of shop uses will be found for a stroboscope. In one instance,

the model shown was used to determine why a tiny sanding drum operated at 15,000 r.p.m. by a small hand grinder caused considerable vibration. Adjustment of the stroboscope speed to make the drum appear to revolve slowly in one direction and then in the other revealed that the shaft was slightly bent, for the end of it described a circular path in-

#### OF SPEEDING MACHINERY

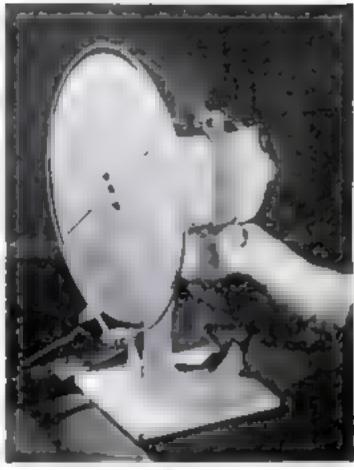

stead of running dead true.

In another case, a movie projector seemed noisy, so the beam of a spotlight was turned on its film-feeding mechanism through the stroboscope, Adjustment of the stroboscope speed to make the feed fingers or

shuttles appear to be traveling slowly revealed that the outside shuttle oscillated sidewise. When the projector was stopped, it was found that there was considerable

Two methods of using a straboscape are shown above. Both appear to halt motion when speeds of the straboscape and abject are synchronized. The disk at the right is encosed in a wire guard

play in the cam operating this shuttle.

Jigsaw blades, shop V-belts, and other moving equipment may be checked in the same way.—Ervin Walters.

#### Water Rheostat Built in Jar Controls Speed of Small Motor

ONE of the easiest and most satisfactory methods of regulating the speed of a small universal motor is with a water rheostat. That shown in the photos and drawing below was made from odds and ends. The container for the water may be any small earthenware or china vase or jar with a relatively large mouth—about 4" deep and 5" in diameter at the opening is suitable for the stroboscope motor shown above. It should

be provided with a round hardwood cover.

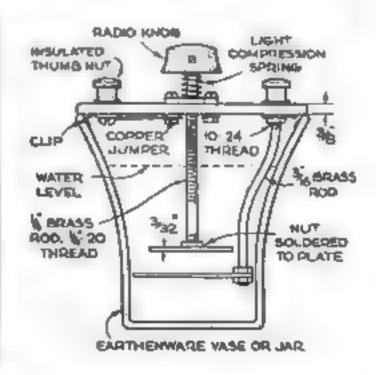

Adjustment is provided by screwing the smaller plate up or down, thus regulating the water resistance between the two plates. The closer the plates are, the higher the motor speed will be. A pinch of table sait in the water may be needed.

On long stretches, the water may get hot; but for 15 minutes or so temperature will remain moderate.— HAROLD P. STRAND.

Connected in series with a small universal mator, a simple water rheastat made like the one shown below will regulate speed easily and smoothly by furnishing a variable resistance between the two metal plates

Meat

WALTER E. BURTON

WHERE do contributors got their ideas? Walter E. Burton, who is one of POPULAR SCIENCE's most prolific, isn't always sure, but he remambers how "Seven Stops in Restoring Old Sciesors" came into being. Helping to

clean aut the garage of a neighbor, he came across a rusty aid pair. On offering them to the neighbor, he was told to throw them away, instead, he took them home, thinking he could fix them up for use in the darkroom. In the midst of the rapair job, it struck him that other people might have old scissors they would like to selvage, so he get out his comme and photographed some of the steps as he want along. The scissors, however, never reached his darkroom—they cut so well after being rebuilt that they were commondered by his sister for her sewing basket.

Burton has been a writer almost all his life. Born at McMachen, W. Va., about the time the Pename Conel and the Wrights' plane were built, he moved to Kenmare, near Akron, Ohio, when he was six, and sold his first magazine article while in high school. Since then he has acquired a college education at Johns Hopkins in Baltimore, Md., and has been a newspaper reporter in Akron, where he now makes his home. He guit newspapers because he didn't like regular hours, and he has been free-landing ever since, writing features, how-to-do-it artidas, a little fiction, and half a decen books. His features caver many subjects, from airplanes to zoos, while his how-to-do-it articles are chiefly on weed and metal projects, photography, and microscopy.

At the left, Burton is shown in his shop, tinkoring with a lathe measuring dial he invented and on which a patent is sending.

# Seven Steps in Restoring Old Scissors

By WALTER E. BURTON

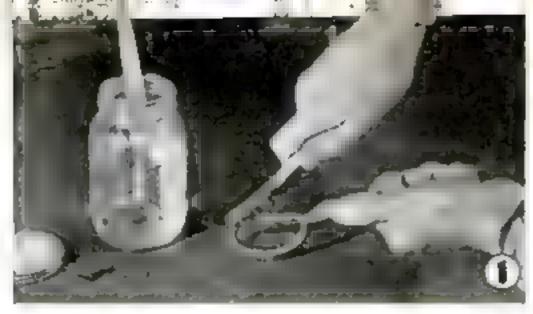

RUST and badly worn blades have consigned many pairs of scissors to the junk barrel. The scissors shown in the accompanying photos had, in addition, overlapping tips resulting from wear in the rivet holes, and one of the blades was bent. Yet, with a little judicious rescue work, they were restored to their former usefulness—really a simple task that may help you put discarded scissors in your home back into service.

The first step is to separate the blades by removing the rivet or bolt that holds them, and then to clean off every trace of rust and old paint, as in Fig 1. A rust-removing solution of the type used in automobile paint shops and a wire brush are efficient.

Next, polish the blades throughout with

abrasive cloth (Fig. 2) until they regain most of their original luster. A drop or two of oil will help produce a fine polish. If a blade is bent, polish one surface of that blade first until it is bright; then heat it gently and evenly with a torch or over a gas-stove burner until the bright area begins to show a yellowish or light-bronze tinge. Take it to an anvil, lay it with the concave side of the bend down, and hammer lightly to flatten it, as shown in Fig. If it is not straight after no more than a dozen blows, repolish and reheat it before further hammering. Such moderate heating (450 to 500 deg. F.) reduces the likelihood of cracking the metal without affecting its bardness.

The cutting edges of old scissors are usually dull, irregular, and worn from frequent sharpening. Use an oilstone (Fig. 4)

to even them up and give them a keen edge. The honed surface should stope slightly. Also hone the inner surfaces of the blades, which are often hollow-ground, to remove rough spots and burrs.

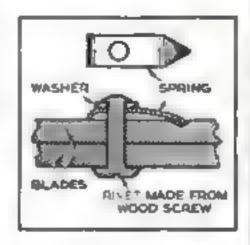

Make a trial assembly of the blades to see whether the tips are even when closed. Usually they will overlap, especially if the screw or rivet holes are worn. In this case, shift the rivet holes alightly by filing with a rattail file toward the cutting edge as in Fig. 5; then redrill them for a larger rivet. If the tips fail to come together, shift the rivet holes in the other direction by filing toward the back of the blades, and redrill as before.

A new rivet can be made from the unthreaded portion of a roundhead wood acrew. File the head to flatten it and, if necessary, file the shank white rotating it in a drill-press or lathe chuck for a uniform diameter and a snug fit. Assemble the blades with the rivet, a spring, and a nut or washer, and head the end of the rivet with a hammer, as shown in Fig. 6. A bolt and nut may be used, but if the bolt is threaded all the way to the head, it may wear rapidly. Secure the nut by riveting the end of the boit lightly.

The drawing below shows a scissors joint with a rivet made from a roundhead wood screw. A flat spring keeps the blades together even if they are bent slightly or if the joint is worn, and it provides a desirable resiliency. If an original spring is lost, one can be made from a heavy clock spring or a phonograph-motor spring after first heating the metal to redness and letting it cool to soften it. After shaping and drilling the spring, reheat it to a cherry red, quench it in water, and temper by reheating to a uniform dark blue. A one or two-turn coll spring or a split washer may be used instead.

Finish the job by repainting the handles, as in Fig. 7, with any good enamel or lacquer. Bake-

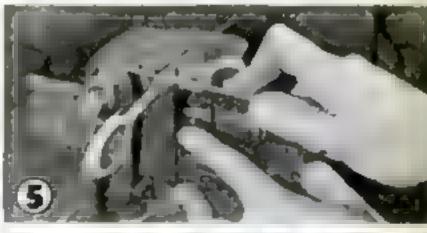

on enamel is excellent if you have it and the facilities for heating it. Wrinkle or crackle enamel, however, should be avoided, for such a finish is uncomfortable for the user whenever prolonged cutting jobs have to be done. A drop of oil between the blades at the rivet or bolt makes them work easier.

# Does Your Boat Winter

SHIPSHAPE POINTERS FOR SNUGGING DOWN YOUR VESSEL

#### By ELON JESSUP

AIN, snow, ice, and sun can do irreparable damage to an improperly laid-up boat during the winter months. One authority estimates that an adequately protected boat will last three times as long as one that is habitually neglected. Another points to rewards more immediate—he claims that your spring-outfitting time can be cut in half, and that a corresponding reduction in the amount of paint and the extent of repairs necessary can be realized, if you will but take a little care in laying up your boat.

All smaller craft, such as rowboats, open sailboats, runabouts, and thinly planked outboards, should be stored under cover in an unheated, well-ventilated, dry place, such as a barn, a shed, an unheated garage, or a covered porch. A steam-heated room or a damp, moldy cellar will quickly ruin a hull—heat dries out the planking to a harmful degree and dampness encourages dry rot.

It is advisable to rest the boat on a pair of sawhorses, on staging, or on the roof beams. Some owners suspend their boats from the rafters with blocks and falls. All such means of raising a boat above the ground or the floor serve to keep it away from dampness and to allow air to circulate freely about it.

Larger boats should also be stored inside, if a large enough building is available for

the purpose. In the absence of such a structure, they may be stored outdoors, either in the water or on dry land. But no matter whether they be affoat or ashore, they should have winter covers to protect them from the elements. If rain and snow are allowed to collect on the decks, the seams will fill with water, which will freeze and force the decks to open up. If water gets in the bilges and is allowed to collect in stagnant pools, it may encourage and nurture dry rot. Sun can ruin paint and cause wood to crack and warp. So boats should be shielded from the ravages of capricious winter weather.

Canvas—a good 10-oz. duck—is the best and most durable winter-cover material. You may buy it either treated or plain—both types are satisfactory. If it is treated, it will be waterproof, or at least water resistant. If it is plain, don't attempt to waterproof it yourself. This warning is given because most home-waterproofing methods depend upon paraffin or oil to seal the pores in the cloth. Both paraffin and oil may contain a certain amount of residual acid, which will attack the cotton in the canvas and cause it to rot and crack, especially in the creases.

If you can't get canvas, roofing paper will do. Either material should be laid over a wooden framework. Simply to throw a cover over a boat without a frame is useless because pockets will form and fill with water, which will slowly seep through the material to the boat, where it may cause great damage, as described above.

# in the North?

DURING THE OFF SEASON

A typical frame consists of a 2" by 4" ridgepole, which runs the length of the boat and is mitered fore and aft to meet the stem and the stern; a series of 1" by 2" rafters, which slope from the ridgepole to the edges of the deck; and several uprights, which support the ridgepole. The frame should have a fairly high peak so there will be enough pitch to shed rain and snow easily.

Figure 1 shows a nearly completed frame. Here the outboard ends of the rafters are braced against the rails. An upright goes to the cockpit flooring. The mast serves as another. Despite the obvious convenience of so using the mast, it is better practice to take all the spars ashore and store them under cover, in which case a short upright between the cabin top and the ridgepole should be substituted in place of the mast.

The canvas in a cover does not necessarily have to be new, nor need it be in a single piece. It can be laid on in sections, like roofing paper. Incidentally, if roofing paper is used, run it athwartships from gunwale to gunwale, not fore and aft. In Fig. 2, a canvas cover is being spread. Avoid leaving any sagging pockets that might catch and hold water. Lash the cover tightly about the mast, as in Fig. 3, to keep rain water out. Fasten it firmly in place so it can withstand the best efforts of a winter gale to rip it off. If the boat is stored ashore, rope lashings running under the bottom will serve. Usually, however, natis and wooden lathing are used. Figure 4 shows such lathing being applied to the rafters. Some boatmen hesitate to make nail holes in the center of a good canvas cover, and rightly so. It may not be necessary to do this if the cover is all in one piece and firmly fastened to the boat, just below the gunwale, with a line of laths. But if the cover is put on in sections or if it is old, it may be ripped off by the wind unless it is secured by laths that are nailed to the rafters and to the ridgepole.

Provide some means of entrance and exit. Figure 5 shows a trap door, like a tent flap, that is convenient when you want to get aboard to bail the bull out or to do any of the winter repair and replacement jobs that are on every boatman's agenda. Use very thin galvanized nails to fasten the cover to the boat. Such nails won't seriously mar the hull. If you have pienty of canvas to spare, let it drop below the gunwale to protect the sides of the boat. Exceptions to this are boats that depend upon portholes and scupper holes for ventilation. Don't cover such openings.

Ventilation is of supreme importance in a covered boat since dry rot cannot flourish in a well-ventilated spot. Usually old canvas that has never been waterproofed is porous enough so no other means of ventilation need be employed. When you use a processed canvas or roofing paper, however, vents become essential. If the boat has portholes, leave them partially open. If it has scupper holes, remember not to cover them. Tiny dormer vents may be set in the cover, as in

Fig. 6. About a half a dozen each side of the boat are sufficient. Lacking all these means of ventilation, the cover may be left partially open at the stern. Try to keep the elements out, but even if a little rain and snow do drive in, they'll prove less harmful to the boat than would a complete absence of ventilation.

Wet storage, or mooring a boat in the water all winter, is probably the easiest and the cheapest way to lay up and some experts consider it to be the best for the boat. They don't like the alternate swelling and shrinking to which a boat that is hauled out is subjected—soaking up water and swelling when afloat and drying out and shrinking when ashore. They prefer to allow the boat to soak up all the water that the hull will hold when it is first launched and thereafter to leave it permanently in the water, except when it becomes necessary to haul to renew the bottom paint or make occasional repairs. Another thing they don't like is the prospect of damage caused by improper handling and shoring, which might result in a permanently warped hull

But it is granted that there are numerous localities where the wet-storage method doesn't work. For instance, it is essential to haul rather than leave a boat in a northern fresh-water lake where irreparable damage would be caused by the thick winter ice.

Salt water is different. There are countless well-protected small basins along our northern coasts where a boat can safely ride out a winter affoat, despite the presence of a certain amount of ice. But even salt-water ice must be guarded against. Thin sheets of window-pane ice look harmless, but can cut into a hull like a sharp knife, and any sort of moving ice is even more dangerous.

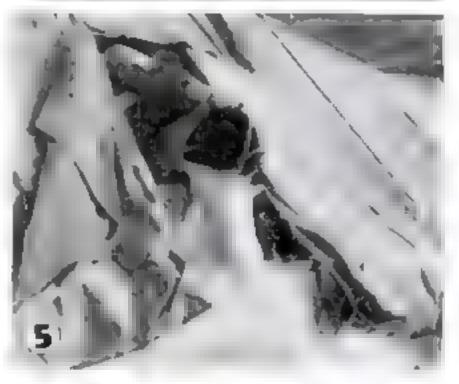

Protection is simple. It entails putting ice buffers around the hull in the area of the waterline. Once upon a time old tires were used for this purpose, as in Fig. 7. Now you will probably find that rope or logs are easier to obtain. If you use rope, festoon it about the hull in such a manner that the waterline and an area either side of the waterline for a distance of about a foot up and down are guarded. If you use logs, float them alongside the boat and temporarily secure them to the hull

Figure 8 shows a group of boats that are safely moored for the winter in a protected salt-water basin. Their winter covers are in place. All that remains to be done is to add ice buffers around the waterlines.

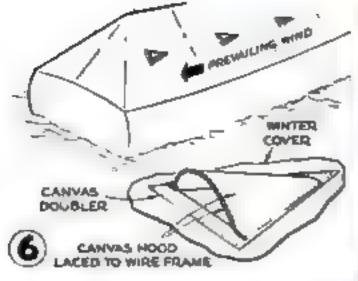

If you decide to haul your boat, rather than leave it in the water, be sure to provide adequate support for it. Three calamities can descend on a boat that isn't well shored up and blocked. First, a winter gale can knock it over. Second, the hull can hog out of

shape—droop at the bow and stern—if the supports are insufficient at the ends of the boat. Third, the hull can sag—settle amid-ships—if the shoring is inadequate along the mid-length. The boat should sit solidly on her keel and be braced so strains are distributed over a wide area, with no undue amount on the keel, the frames, or the planking. Ground in winter, because of alternate freezes and thaws, is an unreliable foundation; so lay long planks to take the lower ends of the shores, otherwise they may sink and leave the boat unsupported.

#### Hauled-Out Boats Require Winter Covers and Adequate Shoring

Left: a well-protected motorboot. The winter house has a wood frame over which is applied a roofing-paper cover. The house is made wider than the hull to allow adequate ventilation. The shares and braces here are exceptionally good, since the boat is supported at numerous places, including very near the bow and stern

Right: a stern view of the same boat showing the after supports and the winter house. Note that a big access door is let into the house to facilitate getting aboard for inspections

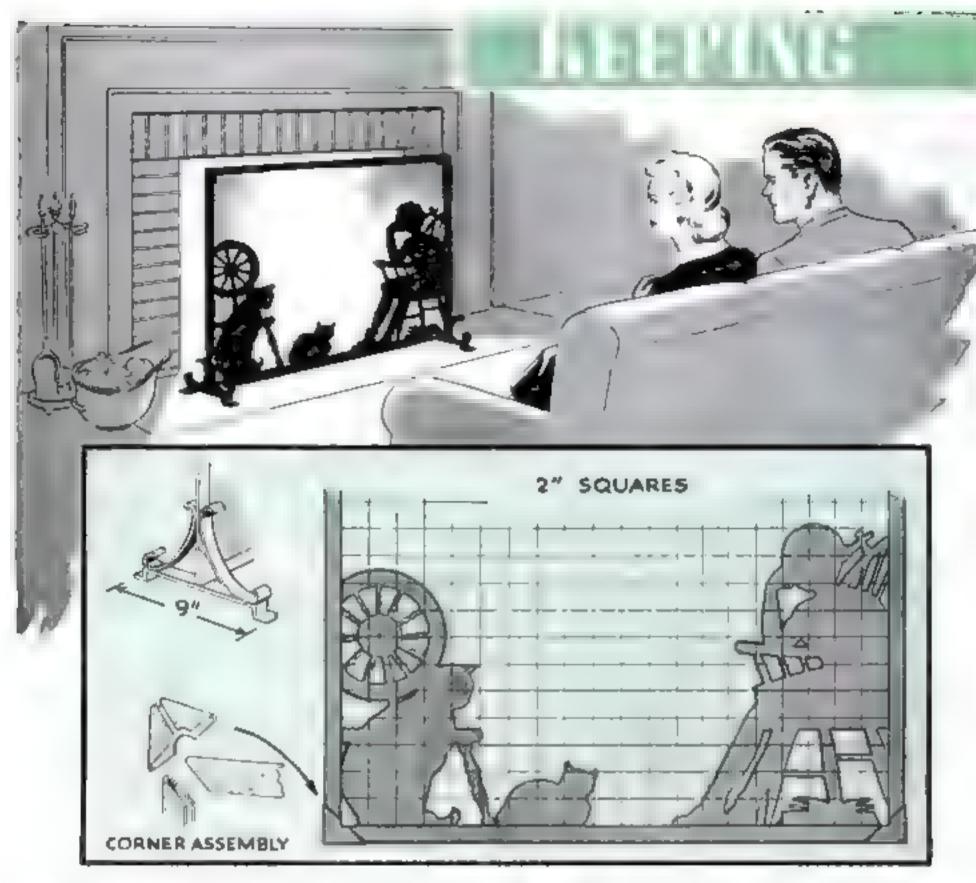

Despite the winter cover, a certain amount of water will find its way inside. If the boat is in wet storage, go aboard at regular intervals and pump her out. If she is wintering on dry land, bore a hole through the lowest part of the bottom to allow such water to drain off. Be sure to remember to plug the hole before launching time.

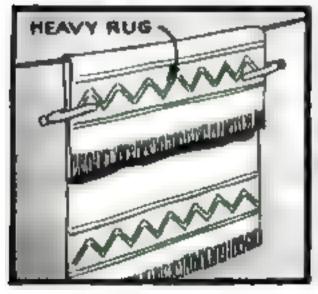

Your engine requires particular attention. Drain off all the gasoline and water. Remove the spark plugs, pour several ounces of lubricating oil into each cylinder, replace the plugs, and turn the motor over by hand

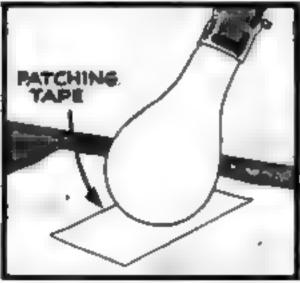

a few times to distribute the oil. Drain the crankcase, flush it out with kerosene, and pack it with waterproof grease. Scrub the outside of the engine to remove all dirt and grease; then cover the bright parts with petroleum jelly and the iron parts with grease to protect them from the damp air.

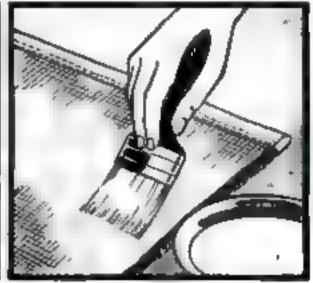

Take all bedclothes, curtains, cushions, and lines ashore and store them in a locker. Stack the mattresses and cushions on edge and hang the lines up. Mattresses and cushions laid flat, one on top of another, and lines coiled on the floor are apt to rot.

Silhouettes cut from black sheet iron, or even from unsalvageable tin-can stock, and riveted to the edge of a fireplace screen, make interesting designs. Lay out the figures on squares and transfer them to the stock. Those shown are for a large screen, but they can be reduced easily. If you have no suitable screen, one can be built of strap iron riveted tagether and copped at the carners with the same stock as is used for the silhouette. Be sure to use only heat-resistant enamel if the cutouts need pointing

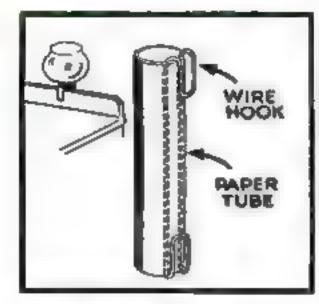

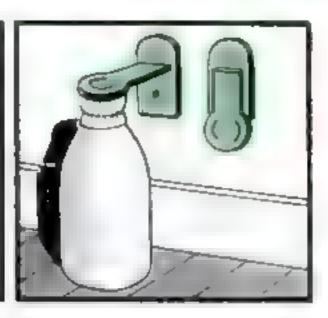

When a rug or other heavy article is hung on a clothestine, putting the clothespins on below the line will keep them from being split

Mending tape of the kind used to patch clothing may be pressed on with a hot 75 or 100-watt bulb if an electric iron isn't available Mix water and a cup of laundry starch into poste and thin with 6 oz. glycerin to make a nonstip backing for a medium-sized rug

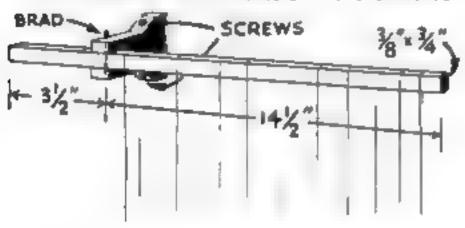

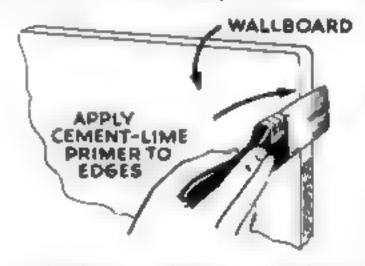

Hooked on the back of a range, as shown, a mailing tube will hold the upper bowl of a glass coffee maker. Cloth stuffed in the bottom absorbs maisture

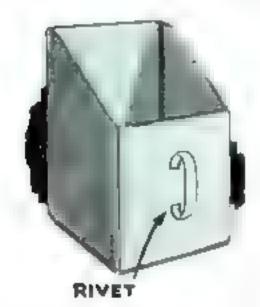

If you can't replace a tricycle tire, use a V-belt made for an outo fon, it should be I" less in circumference than the wheel and stretched on over the rim Stray dogs and cats can't get into milk if the bottles are held down by the ends sawed from a discarded paper-towel holder. Arrange the arms to drop flat when not in use

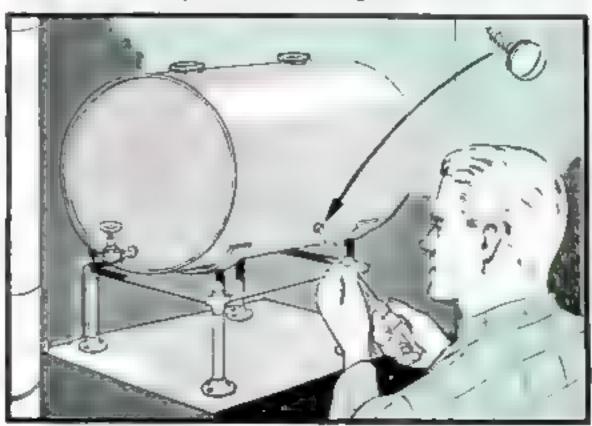

Side curtains hung on a pair of rads made up of hardwood to the dimensions shown and installed at the edges of a narrow window will make the space appear larger. Have the short ends on the inside

Edges of soft-type wallboard, used unframed and unpointed for screens, table pads, and the like, can be protected by a coat of coment-time primer. After the primer dries, smooth it with sandpaper

Cut from a square 5-gal, can, as shown, and equipped with a handle made from the leftover stock, the handy dustpon above is also a wastebasket. Turn and hammer down all edges, and point and decorate to match a kitchen or other color scheme

Pinhole leaks in a tank can after be plugged up satisfactorily with small self-tapping screws, as shown below. For a tight seal, use a leather washer or a piece of rubber as a gasket under the screw head

# Who's Afraid?

# SOME ANIMALS POSE FOR PHOTOS LIKE SEASONED CELEBRITIES; OTHERS SHRINK AND SNARL AT THE GLARE OF THE FLASH BULB

ATIVE ferocity doesn't always make an animal brave when it faces a camera; neither does timidity necessarily cause another to shrink. That s the experience of Isabelle Kauffeld, noted zoo photographer,

who took these pictures of familiar and strange creatures at the Philadelphia Zoo.

Most animals expect a flash bulb to accompany the black box pointed at them, and some of the most formidable become terri-

> fied even before the photographer has finished setting up his camera. Others go about nonchalantly with no discernible reaction. But neither flerceness nor gentleness is a criterion of behavior while posing.

Maybe the "Who's afraid?" would apply better to us than to this specimen from Mrs. Kouffeld's camera. But it's only a lizard—although a big one—an iguana. Lizards are apt to be nervous at first, but they soon settle down and aren't bothered by a flash

This hondsome little fellow with a white beard—a Diana monkey—was actually terrified at almost the moment the camera was brought up although it had seldom had to pose for photographers. Its terror can be seen as it retreats in the cage

Just the apposite effect, if any, was produced on the big guy at the left. Hippopotamuses don't seem to be afroid of either the camera or the flash bulb; at least, they don't show it. This one kept its mouth open the whole while, hoping for food, no doubt, as its reward

Look at the king of beasts. Lee may be the lord of the jungle, but in a cage when the photographer makes an appearance, it's a different story. This lien has been photographed many times, but its reaction is always the same—terror. Here it backs off as far as possible in an attempt to escape, crouching and snarling out in fear as the flash bulb goes off

Trained animals such as sea lions take the comera and flash buibs as part of life. Clarabelle here goes through her routine, clapping away with her flippers and not paying the least attention to the photographer

Very little can disturb the spectacled cayman shown below. All crocodilions are sluggish until aroused, but when not approached too closely, they will remain motionless even with buibs flashing.

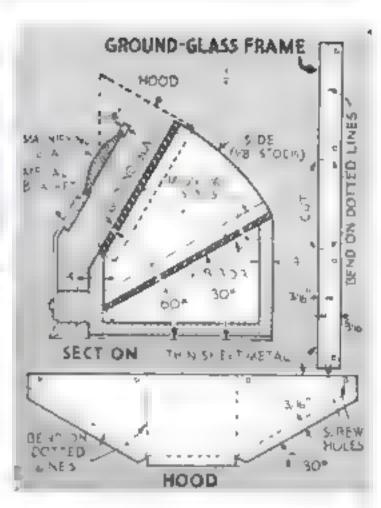

This last baby is one the photographer can have. An Asiatic spitting cobra, or any other cobra for that matter, is not our idea of a Powers model. For the record, though, snakes don't mind having their pictures snapped. They don't blink in the flash glare either—they con't, for they have no eyelids

Though not necessary, a magnifying lens is an additional help in obtaining the maximum sharpness. A block of wood, a metal arm, and a ring of composition board hold it. At the left, no lens is used

NEEDLE-SHARP enlargements are made easier with this focusing aid, which is a simplified version of several excellent commercial devices. The chief materials needed are a small handbag mirror, a ground glass, and several small pieces of %" composition board. A magnifying lens is also useful.

As shown in the drawing, the composition-board sides project 1/16" below the base. To hold the mirror, two strips are glued to the sides at a 30-deg, angle with the bottom, and another pair of strips are attached above the mirror. The ground glass is mounted, ground side up, on the 60-deg, top edges of the sides; it is held from sliding by a small strip along its lower edge and retained by a metal angle strip. The hood shown is optional but useful. It can be made either by cutting a piece of tin-can stock to the pattern shown, or by extending the sides so that they serve as sides for the hood,—CARL W. BERTSCH.

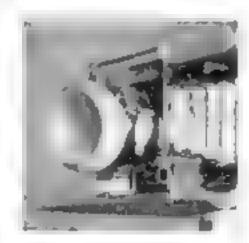

DRYING PRINTS in a paper-towel roll is a handy trick, especially for those last few enlargements that are crowded out of the blotter roll or book. Simply unroll several yards of paper and place the prints so that when the paper is rolled up again, the emulsion side faces outward. If allowed to dry fully, the prints will have a curve sufficient to counteract their natural tendency to curl inward. The paper towels will not be harmed—George Eicher, Jr.

SALON MOUNTS that have become dirty from long use or excessive handling need not be thrown away if they are in otherwise good condition. As a rule they can be cleaned perfectly with ordinary wallpaper cleaner. Rubbing the entire exposed surface with an eraser will also save a mount that seems destined for the wastebasket.—H. K.

A RUBBER LENS SHADE that will serve both to keep out unwanted light and to protect the lens and shutter from accidental blows may be made from a toilet-tank ball. Be sure to use the large rubber ball valve,

not the float. Pry off the metal jacket, if there is one, and cut a hole on the opposite side to fit the lens barrel. Test the shade with a piece of ground glass or tissue paper to make certain the lens field isn't restricted.—HERMAN KLEIN,

#### LIST OF THE WINNERS

1st Prizer L. W. Bullard. Williston Park, N. Y.

2nd Prize: Frank J. Powell, St. Elmo, Ill.

G. S. Frast, Jr., Baldwin, N. Y

Wm. McGinnis, Jr., Nashville, Tenn Pfc. John R. Tadd. Hunter Field, Ga.

4th Prize: Victor Williams, Price, Utah

5th Prize: Wm. Braverman, San Francisco, Cal 6th Prize: C. G. Birckhead, Washington, D. C.

7th Prize: F. K. Shackter, Philadelphia, Pa-Bih Prize: H. O. Sumann, Savannah Ga

REAL skill in a difficult branch of thotography, plus imagination in the choice of subjects, marked a large number of the entries submitted in our recently concluded photo-puzzler contest. In fact, so many of the superclose ups were of high caliber that the judges proclaimed a four-way tie for third place, adding three prizes to the \$50.00 in awards originally offered

Some idea of the difficulties facing the judges may be gained by scanning the first six prize photos, shown in their winning order on this page. Don't forget, though, that it will probably be easier for you to identify these necessarily reduced reproductions than it would be with the original large prints. After you've made your guesses as to what these superclose-ups are, turn to page 189 for the right answers, shown photographically in the case of the first four winners. We'll give a couple of

hints: picture C isn't a necklace, and picture E does not show a plate of doughnuts'

# Give Your Photos Drama

## NAVY CAMERAMEN SHOW HOW TO CAPTURE VIVID ACTION THROUGH CLEVER USE OF LINE, LIGHT, AND EMOTION

AR at sea and in the air has its essentially dramatic moments, and Navy camera artists have succeeded in embodying its drama in many unforgettable photographs. Those reproduced here were taken aboard carriers and escort ships on taskforce service in the Pacific theater by a unit headed by Commander Edward J. Steichen, who in prewar civilian life was

one of the world's outstanding photographers. Careful study of them will help advanced amateurs to get the same dramatic quality in their pictures even if they can't visit battle areas.

One of the many interesting features of these photographs is that, although none of them depicts violent action, they all tell the story of the Navy's air warfare every bit as vividly and dramatically as to more sensational pictures of bursting bombs

and crashing planes

The picture on the facing page is a tine example of how "line" may be used to give dynamic action to a photograph. If the cameraman had made the exposure a second earlier or a second later, the result probably would have been a static picture of slight interest. By pressing his shutter release at exactly the right instant, he caught the crewmen at the moment when the lines of each man's body expressed purposeful movement. Another feature worth studying is the skilled use of light and shadow to give depth-to make you feel that you are looking onto the picture rather than merely

Maving a damaged plane on a carrier flight deck could have made a life ess picture. It didn't—because the Navy cameraman snapped at exactly the instant every line of every crewman expressed purposeful action

Skilful composition is what gives distinction to the photo above of a Dauntless dive bamber signaled back to its carrier. At left, returned from a strike, a pilot tells his story. The smiling airman in the background helps make the photo a standaut. Below, shutter release at the right moment puts drama in this Hellcot-fighter pilot's return

looking at a representation printed on paper.

Still another interesting example of the use of "line" in composition is provided by the reproduction at the top of this page. Notice the clever arrangement of vertical and horizontal lines.

The photograph at the center of this page

Taking the plane against the sky puts the feel of leashed power and grim purpose into the photograph above of a Kinglisher Scout on a catapult about a light cruiser. At right, excellent composition combined with effective use of light and shadow gives this unusual picture of divine service on a carrier hangar deck exceptional emotional appeal

Alertness by the Navy cameromon cought the study in express ons below as crowmen near a loudspeaker stened to a pilot's grimly amusing battle to e

was taken in the pilots' ready room on a carrier. Pilots of five bombers who have returned from a strike against Wake Island are reporting to interviewing officers. One of them is telling what his 1,000perinder sid to a Jap installation. His gesture gives the composition action. But the sn ling istener a most hid lenn the background also helps to hold the picture together and to drive home its story Put the tip of your larger over his face and see now much the photograph loses in meaning and drama

At the t p of the facing page is a photograph of a Helicat fighter being maneuvered into position on the

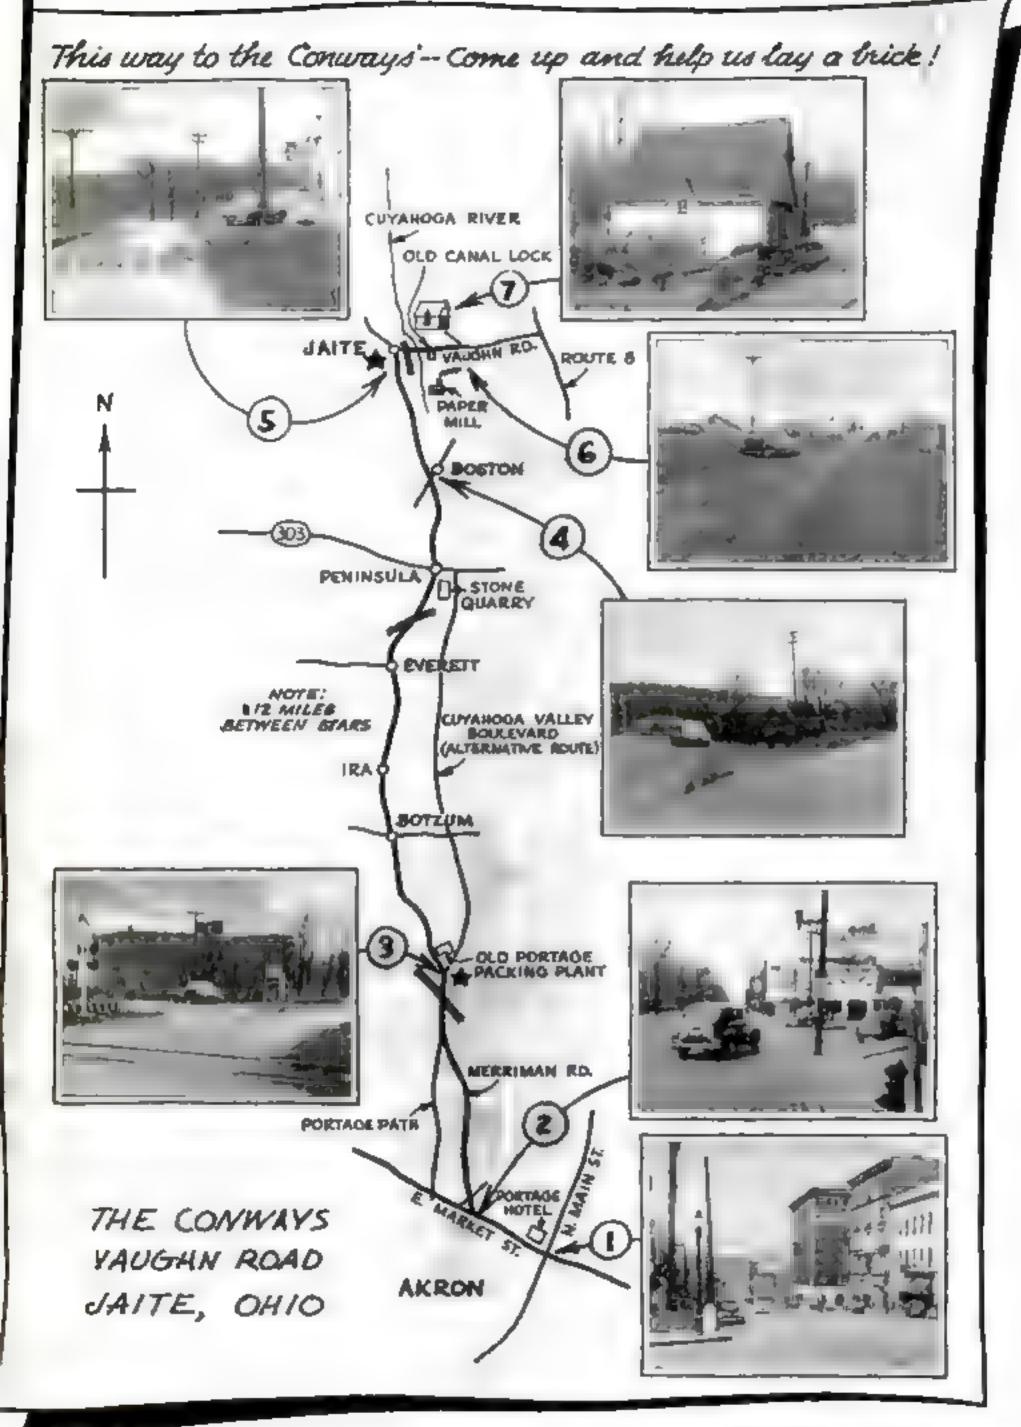

o Helicat being moneuvered into position. Note how the plane parker -wearing the white helmot-puts action and meaning in the picture

Silhouetting men, planes, and antiaircraft guns against a Pacific down dramatizes the fundamentals of naval air power in the picture below. It was taken on a carrier moving in to strike against Raboul

flight deck of a carrier. It is another excellent example of the use of an unobtrusive but dominant figure to give a picture meaning. The white-helmeted plane parker is scarcely noticeable at first glance, but without him the photograph would be nimost static and almost meaningless

Emotional appeal is a rare quality even in good photographs. The picture of divine service before action on the hangar deck of a carrier has it to a notable degree. Excellent composition and lighting, and the fighters in the background. take it a remarkable photo-

### PHOTO MAP TO DIRECT YOUR FRIENDS

F PEOPLE have difficulty finding your home, a photo map may save your visitors time and trouble. Similar maps may be useful for directing groups to a picnic ground.

Sketch on a large sheet of paper a map showing the main roads, intersections, and turnoffs between starting point and destination. Then select points at which someone could go astray and photograph them—preferably showing a readily distinguishable landmark and an auto headed in the right direction. Trim the prints, paste them on the map where they won't cover essential details, and connect them with arrows to the points they depict. Use black India ink for all markings. Indicate mileage between points where possible.

Finally, photograph the map to get a copy negative and make as many prints as desired to distribute to your friends.

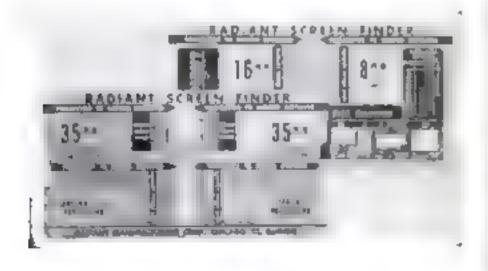

#### FOR CAMERA USERS-

FILM-TRANSPARENCY VIEWERS with an adjustable eyepiece are now molded from plastic and include a light-diffusing unit of frosted celluloid. Focusing to suit the individual eye is accomplished simply by turning the eyepiece in front of the lens until the film or color transparency in the holder can be seen clearly. The new viewers are produced by the Plastic Die and Tool Corporation, of Los Angeles.

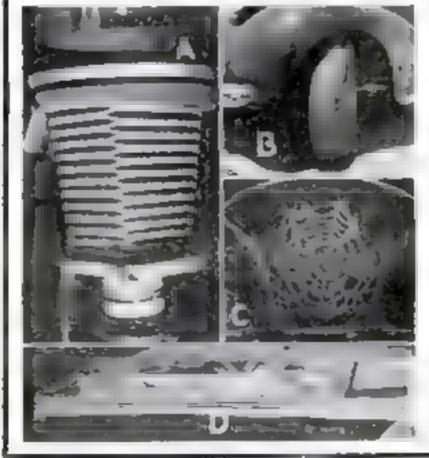

COLOR FILM HAS NOW APPEARED on the civilian market in a type that can be processed at home by the user. Developed by Ansco at the request of the Army and Navy for a color film that could be processed in the field, it was until recently available only for the armed services and for war industries. The new film is composed of three layers of photographic emulsion containing colorless dye-forming aubstances. It can be processed in 90 minutes, only 15 of them in total darkness.

WHAT SIZE MOVIE SCREEN is best suited for various distances between screen and projector with a given lens is answered by a pocket slide scale that is durable, compact, and easy to read. Made by the Radiant Manufacturing Corp., of Chicago, it also tells what model screen to select for particular needs, distance between screen and projector for a given size picture, the lens to use, and showing time for 8-mm. and 16-mm. film. Similar data for slide projection appears on the reverse side.

#### ANSWERS TO PHOTO PUZZLERS

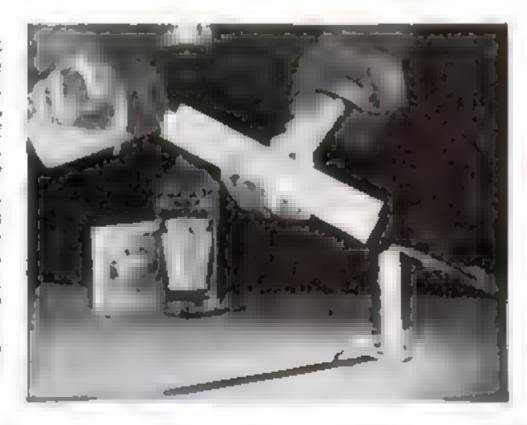

Below are the answers to the photo puzzlers on page 183, A. Folds of an enlarger bellows, B. Auto tire tread, C. Dew on a spider web, D. Edge of a magazine. E. Cheerloats cereal. F. Typewriter keys.

GASES ARE LIGHT in weight, but many are heavier than air. Some, such as gasoline vapor and vapor from carbon disulphide, are also inflammable. For a dramatic demonstration, put a few drops of either liquid in a tin can from which the top has been removed. Use only a few drops and keep the supply container far from any open flame. After a minute or so, go through the motions of pouring the vapor into another can. Now pour the second can over a candle flame. There will be a sudden flashharmless if you have used little liquidshowing both that the vapor really has been poured into the second can and that it burns.

CARBON DIOXIDE GAS is another that is heavier than air and can also be poured like water, but it differs from gasoline vapor in that it will put out a flame. This property makes it one of the important agents used as fire extinguishers. Put a little bicarbonate of soda (baking soda) in a large glass and add a little vinegar. Carbon dioxide gas will soon fill the glass. To prove it, pour the gas over a candle flame, and the flame will be extinguished. For a still more impressive demonstration, pour the gas through a mailing tube or down a paper trough, as shown at right, to show that the gas readily follows the incline to put out the flame.

VISIBLE CHANGES in solids and liquids are caused by some gases. Make sulphur dioxide gas by adding a little of any of the common acids to a small quantity of sodium sulphite or sodium bisulphite. and pour the gas into a tall glass, as at left, covering the glass to keep the gas in. Dissolve some potassium permanganate in water to make a pale-violet solution, and pour this into the apparently empty tali glasa, as at right. Sulphurous acid formed by the gas and water will bleach the liquid clear. This is an impressive stunt if prepared fust before visitors come to your lab. It's best to perform it with the windows wide open, though, as the strong odor of the sulphur dioxide is likely to be unpleasant in a closed room.

OXYGEN unites so readily with some substances that the result of the reaction enables us to determine the proportion of oxygen in air. To 1 oz. water in an 8-oz, bottle add half a teaspoonful of one of the photographic developera, hydroquinone or pyro, and an equal amount of common lye. Stopper the bottle quickly, invert it, and mark the level of the liquid on the inverted bottle. Let the solution cool (the lye will have

heated it) and then shake it vigorously. Oxygen will leave the air in the bottle and go into the solution, turning it almost black, a product of oxidation familiar to all who have used and stored photo developers.

Hold the mouth of the bottle under water and withdraw the stopper slightly, lowering

the bottle to equalize the level as outside pressure forces water in. Replace the stopper when the flow has stopped, and remove the bottle. Now compare the level of the liquid with the earlier mark, and you will find the ratio of displacement approximately 1 to 5—the proportion of oxygen in air.

POROUS MATERIALS, such as charcoal, silica gel, and spongy platinum, have the power of absorbing gases or of holding them closely to their surface. That is the reason why materials of this kind—some with microscopic pores—are employed in removing food odors, in keeping poison gas from pene-

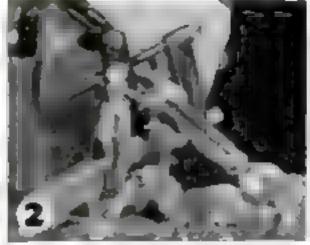

trating gas masks, and as catalysts to unite several different gases. A little powdered charcoal will demonstrate this principle of absorption. Use it with a harmless gas, such as the vapor from a moth ball, that can be detected easily by smell.

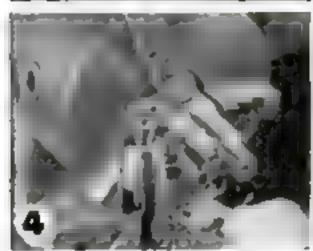

Put a moth ball in a jar and then remove it when the jar begins to give off a strong odor of naphthalene. Next, add a teaspoonful of the powdered charcoal to the jar, screw on a cover, and shake the container vigorously. Allow the charcoal dust to settle, and then uncap the jar and smell it again. The naphthalene odor will have completely disappeared, showing that the charcoal has absorbed the gas. In this case each of the charcoal particles holds the naphthalene vapor securely to its surface.

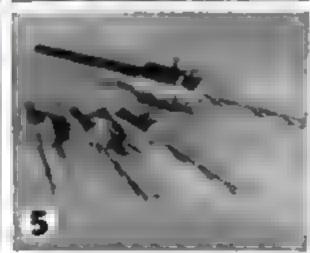

### NEW SHOP IDEAS

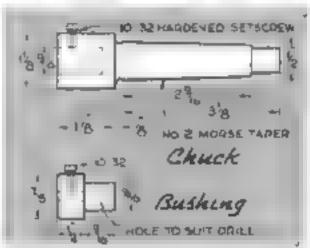

### Tapered-Shank Drill Chuck and Bushings for Use In a Lathe

A CONVENTIONAL drill chuck for use in a lathe is rather expensive. Here (Figs. 1 and 5) is a simple substitute consisting of a tapered-shank chuck and a set of bushings, each of which has a hole to take a drill of a specific size. The tool may be used either in the headstock or in the tailstock, as the job demands.

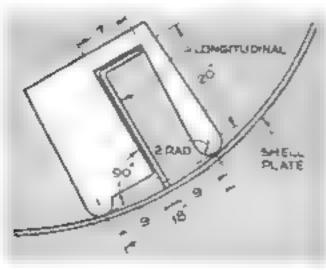

To turn the Morse taper shank, mount the material between centers on the lathe and add a lathe dog. Using the set-over tailstock method, rough-turn the taper, leaving the small end about .020" oversize (Fig. 2). Test the work by using the tailstock as a taper gauge. If the taper is correct, the tailstock will slip on for about three fourths of the length of the shank and there will be no play or shake. If a perfect fit is not realized, change the setting of the tailstock, take a light cut, and try it again. After obtaining the correct taper, turn the shank to size with light cuts, testing it frequently.

Before making the final cut, coat the taper with Prussian blue and twist it into the tall-stock. If smudging indicates it is seating evenly, make the final cut and polish the shank with emery cloth.

Remove the lathe center and slip the tapered end of the work into the headstock spindle (Fig. 3). Turn the unfinished end to size and bore a 9/16" hole to receive the bushings. The chuck is completed by drilling and tapping a hole to take a 10-32 hardened setacrew.

The bushings are turned to size from short pieces of stock (Fig. 4), centerdrilled, and cut off. Each center hole is opened out with a drill of the size that is to be used in the bushing. Both ends are faced, smoothed and the larger end is chamfered, as indicated in the drawing. A hole is drilled in the head of each bushing to take a 10-32 set-screw. Hollow-head setscrews are preferable to the kind shown.—C. W. W.

### Gauge for Setting Members Vertical to the Chord of a Curve

CLAY DYER, a loftsman at the Marinship Corporation, Sausalito, Calif., designed this gauge as a device for quickly setting longitudinals at right angles to curved shell plating. With the former method it was frequently necessary to scarf and reset various longitudinals when they failed to meet the connecting brackets properly.

While this gauge was primarily designed for use in the shipbuilding industry, it could be adapted for use in other structures—such as tanks or silos—where a member must be aligned vertical to the chord of a curved surface.

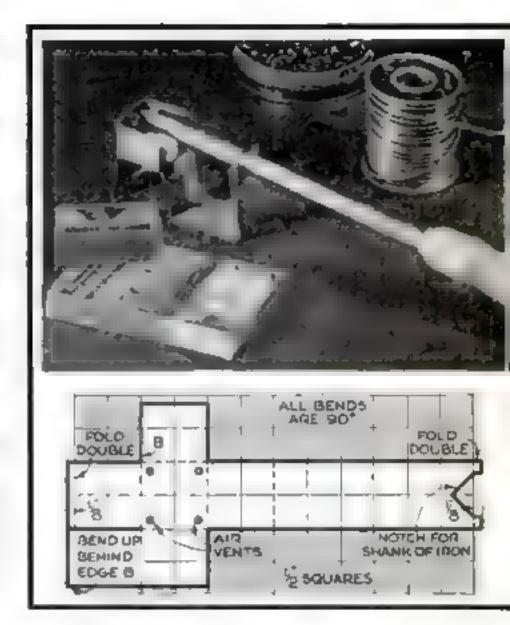

VI W CUITE BUILD

## Soldering-Iron Heating Stove Uses Concentrated Tablet Fuel

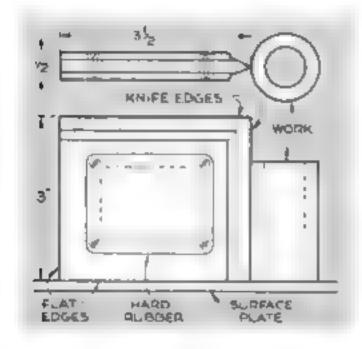

WHEN ordinary heat sources are not available, a small soldering iron may be heated with tablet fuel in this tiny stove, which is made from scrap sheet metal or tin-can material. (The soldering iron shown in the picture is an old electric one, the element of which had burned out.) Cut the metal to the shape shown in the drawing and bend it as indicated. Punch a hole near each corner of the fuel recess to improve the draft. Use fuel tablets that are %" in diameter as a source of heat—a small one burns about seven minutes and a large one twice that long.—W. E. B.

### Washers Under Motor Kill Noise

If a small electric motor is mounted directly on a stand or bench, it may be quite noisy. This tendency may be overcome by providing a sound-deadening cushion mount in the form of one or two garden-hose washers under each of the motor supports.—Louis Chirey

### Universal Box Square Insures Perfect Small-Part Alignment

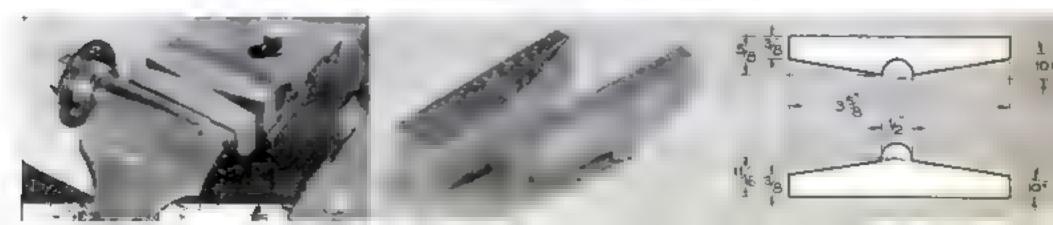

For checking small parts where extreme accuracy is required, this universal box square will prove to be handy. It is made of a 1/4" by 3" by 31/4" piece of tool steel. Square the material all around and, using a 1/4" end mill, machine out the center, as indicated by the dotted line in the accompanying drawing. Such an end mill will give a good radius at the corners. Then, using the same end mill, rabbet both faces to take hard-rubber inserts, which are held in place by 8-32 machine screws. Shape the two knife edges as shown, preferably in a shaper with the tool head set at 30 deg. Round the faces into the knife edges with a 1/16" radius tool to give a neat, finished appearance. Finish the square by hardening, grinding, and lapping accurately to size.—H. D. Chapman.

### Swivel Taper Blocks Hold Tapered Work Securely In a Vise

THE problem of how to hold tapered work in a vise can readily be solved by using a pair of swivel taper blocks, as shown below at the left. These blocks automatically set themselves to the angle of the work and hold it securely without damage or danger of slipping.

They can be made from cold-rolled steel, brass, or other scrap material. The center illustration, below, shows them partially completed. The semicircle in the female piece is drilled, as shown, before the block is finally cut to shape. Both pieces can be formed accurately on a metal-cutting band-saw or a shaper. They should be finished by hand filing to obtain an accurate swivel joint that will rock freely and adjust itself to the work being held.—C. W. W.

### POSTWAR HOME HEATING WILL BE DIFFERENT . . .

# Good-By to Coal

### "VEST-POCKET" FURNACES OF RADICALLY DIFFERENT DESIGN

By GOLD V. SANDERS

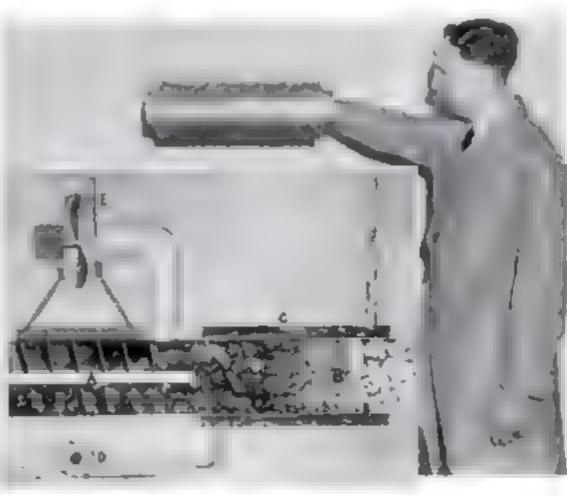

O MATTER what kind of house you plan for after the war—whether it's to be a cottage or a mansion—you are in for a big surprise when you talk to your heating contractor. Even if you don't intend to build a new home, there are radically changed and vastly improved heating units in the making that can be installed either in your present system or in place of it.

Already announced is an anthracite furnace that you can almost carry home under your arm; it is completely automatic and occupies a space of only 2' by 2' by 3'. For soft-coal users, a revolutionary new smokeless stove with a magazine-type feed is soon to be on the market. Gas has been util-

ized for air conditioning, with the manufacturers ready to offer a winter-and-aummer system that warms the air in cold weather and cools it in hot, while another system has a compact, vertical, small-home heater that can be tucked away in a hall closet. An electric unit, working on the reverse-cycle refrigeration principle, has been developed to extract heat for the

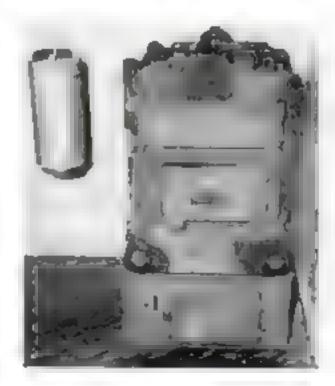

New ideas of combustion are embodied in a furnace that looks like a length of pipe. Below, a space heater embodying the same principle set up in a testing laboratory Along with changing heating characteristics in fuel, oil burners have been and are being improved with a view to more economy for the user and more efficient operation. Radiant heat, with coils of pipe built right into the floor, will be available for new construction. Out of our stratosphere warplanes has come a "vest-pocket" heater that is being studied for application to home use. And with the development of insulated glass, the sun itself is being brought into the picture at least as a supplementary source of heat even in bouses in the cold north.

Coal stokers are being simplified and made more compact. New materials, including newly discovered ceramic blends, are going into the construction of heaters.

では、アンファ

Here is how the furnace works. Coal is fed in by the worm A and burns at 8, osh being pushed out at the end. Water heated in the jacket C is pumped in at D. Air pulled through by a fan E speeds combustion. A complete furnace can be set up in a 2' by 2' by 3' space in contrast to that needed for the old furnace shown at right. Anthrocite Industries. Inc., did the research

# Shovel Drudgery

### PROMISE MORE COMFORT AND AUTOMATIC OPERATION AT LOW COST

Better ways of using fuel are planned to squeeze every B.T.U. out of coal, coke, gas, and oil. New units convert coal into coke inside the fuel magazine and then burn it in the firebox with intense heat.

Some of the equipment may appear to be expensive; other types will be surprisingly low in price. A few of the systems may be practical only for large homes where the overall cost of construction will keep that for the heating plant within a reasonable percentage. Yet it may be entirely possible to install complete equipment in a cottage-type house for under \$100.

For all varieties of equipment, the trend is decidedly toward conservation of space and fuel, elimination or simplification of moving parts, and more efficient and more automatic operation. All of which points to lower operating costs regardless of initial investment and, what is equally important to most of us, the end of coal-shovel drudgery

Working from entirely new combustion principles, scientists sponsored by Anthracite Industries, Inc., have developed from eight years of research a midget hard-coal furnace that will occupy a space of only

2' by 2' by 3' and is completely automatic. It is self-fed by a continuous screw and discards ash at the far end. The firebox is simply an 18" length of pipe 4" or 6" in diameter, depending on the size of the house to be heated.

There is none of the secondary heating area found in most furnaces; all combustion takes place in an area about 4" long. Only a small amount of coal is ignited at one time, but it burns at a furious rate, assisted by air drawn through the chamber by a suction fan. Heat is carried away rapidly, too. by a small electric pump circulating water through a 1" jacket to pipes leading to the radiators. Coal is fed constantly into the combustion chamber by a worm that keeps raw coal, burning coal, and ashes moving slowly toward the end where the ashes drop out. Rapid convection of heat and complete thermostatic control hold the actual temperature in the firebox so low that clinkers do not have a chance to form, according to the anthracite association, and only pow-

Panel or radiant heating of a home is done through a system of heat-conveying pipes under the floor, as shown by this demonstration model. Heat is uniform in all parts of a raom

dered ash is delivered into the ash receptacle.

A 4" pipe can carry off smoke and fumes, eliminating the necessity of a conventional chimney.

Only the basic burner has been developed by the anthracite association. This is being turned over to the manufacturers of heating equipment throughout the country and will be adapted to their individual designs. The combustion principle can be applied to hotwater, steam, and hot-air systems equally well. Installation can also be made in existing equipment, thus utilizing the heat-circulation system already present in an old house, Raw coal can be fed to the worm from either a hopper or a self-feeding bin.

The same combustion principle, not confined to central heating, has already been adapted for use as a space heater. In this unit the pipelike furnace is turned vertically and the coal is fed to the fire pot by gravity instead of by a power-driven worm. A magazine holding 100 lb. or more of coal is provided at the top so one loading can

For soft-coal users, the Bituminous Coal Institute has developed a smokeless burner that consumes gases and smoke, will hold a fire for a day or more on one charge, and will heat a four or five-room house

take care of the heating problem for a day or more without further work or attention. The space heater is also controlled by a thermostat that stops and starts the suction fan to regulate the rate of burning.

There is equally revolutionary equipment ready for the user of soft coal. The Bituminous Coal Institute has just announced a new smokeless heater, born of its own research program in which 27 stove manufacturers co-operated. Here again a new combustion principle was evolved to provide an ample supply of air at the right points, a series of high-temperature refractory flues. and a path of travel for the gases that causes them to burn away, thus not only eliminating smoke, but also effectively recovering a much higher percentage of the heating value of the coal. A saving of as much as one third in the fuel bill is claimed as a result of employing the principle, to say nothing of the relief from amudge in the house and over the neighborhood.

The soft-coal heater is equipped with a magazine feed designed to take a load that will feed the firebox for a full day or longer. Regulating apparatus makes it possible to control the rate of coal consumption and the heat from the stove.

Called a bungalow furnace because one unit will effectively heat a house of four or five rooms, the heater will burn any type of bituminous coal, even low-cost unscreened run of the mins. Accent has been on heating stoves, but actual development of designs that will reach the market is in the hands of

the 27 stove manufacturers who helped to finance the research, and it is highly possible that some will come out with central-heating plants based on this principle. A streamlined and ultra-modern kitchen range, incorporating the same combustion principles, has been built for use with either coal or wood.

Another development that holds promise is a down-draft burner for the smokeless combustion of soft coal. This was recently announced by scientists at the University of Illinois. The burner fits into the furnace combustion chamber where it can be fired through the door. A bollow baffle divides it into two chambers and admits air that helps in the burning of smoke and gases.

At Ohio State University, engineers have constructed ceramic heaters employing mostly hollow tile made by the careful blending of raw clays. In these ceramic heaters, coal is reduced to coke within the stove before it is ignited by means of convector passages that impart heat to the charge in the magazine. Ceramic coal ranges are also being made.

Automatic feed for coal and coke furnaces is undergoing important changes. While the hopper-type feed will continue to be popular, especially where one charge can be made to last for several days, there are completely automatic stokers that feed themselves directly from the bin. One such stoker conxists of a rakelike arm turning constantly in the bin and raking coal toward the center and toward a worm that catches it and feeds it into the furnace. Others are made possible by simple changes in bin construction such as building in a funnel-shaped bottom that will allow gravity to drop the coal into the worm or other contrivance for conducting it to the furnace. Several such bins have been developed by the Anthracite Fellowship and the Mellon Institute of Industrial Research and are being offered to the trade. Various sizes of coal have been used in automatic stokers, some of which blow coal dust through a jet so it burns something like oil, and some even powder the coal in their mechanism.

The makers of oil-burner equipment have long been at home with automatic heating, and many efficiently designed furnaces had

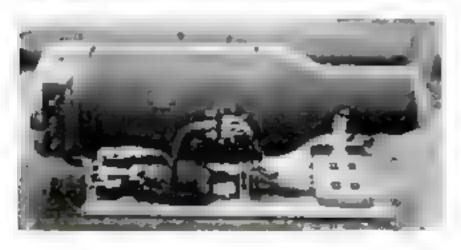

been put on the market before the beginning of the war. Now that new heating characteristics and new blends have been brought out in fuel oil through war and other research, oil-burner mechanism is being adapted to utilize them with increased efficiency. The result for the home owner should be lessened oil consumption and greater economy

New orifices mixing the proper proportion of air and gas—some of them not requiring adjustment after being installedhold promise for increased efficiency in gasburning automatic furnaces, and improvements in the design of the furnaces themselves are expected. One new gas furnace is a compact vertical heater that is really an air conditioner. Its vertical design reduces the floor space required for installation and makes it especially suitable for small homes, where it may be housed in a hall closet or set up in the kitchen, attic, or open hallway. Cold air is drawn into the furnace and filtered, heated, and humidified before being circulated by a large-capacity blower-type fan.

In the field of air conditioning for both summer and winter, gas units have been developed for warming and humidifying the air in cold weather and for cooling and drying it in warm weather. The latter is an application of the same principle employed in refrigeration by gas. Ducts used for hot air in the winter serve for cool air in the summer. As in other air-conditioning systems, the air is filtered during its passage through the conditioner. The refrigerant used is simply water.

Another development in air conditioning employs the principle of compression-type refrigeration in a unique way to give heat when needed as well as cooling. Known as the reverse cycle method, it has been used in commercial buildings and it is also adaptable to residences. Its principle is that of the common electric refrigerator. Just as the compression and expansion of a refrig-

"Vest-packet" heaters made by Stewart-Warner for stratosphere warplones may well be adapted for home use. One is shown below. The vertical gas-fired burner shown at the right is an air-conditioner built by Bryant for small homes. It occupies so little floor space it can be installed in a closet

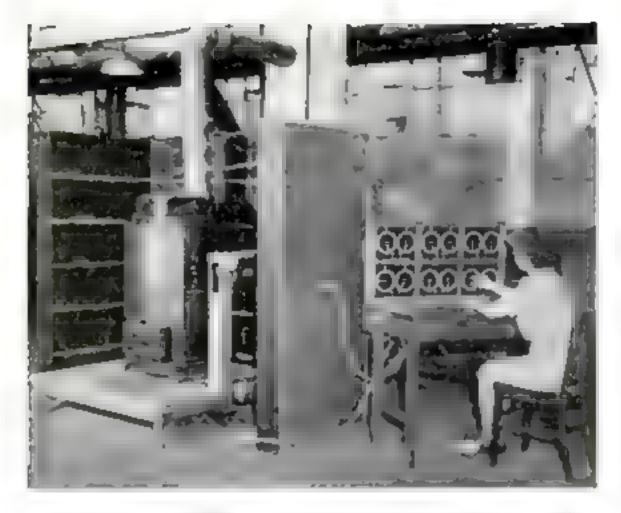

crant results in a transfer of heat from inside a refrigerator to the air outside it, so a larger system transfers heat from a house to the out-of-doors. The reverse cycle comes into operation in the winter when, strange as it may seem, heat is extracted from the frigid outdoor air and released inside to warm the house. This is possible because beat is present at all temperatures above absolute zero, or -273 deg. C. Normally, however, heat flows from a warmer area to a colder. To reverse this flow and transfer heat from outdoors to build up a higher temperature indoors, energy must be expended. This energy is in the form of electricity necessary to run a motor and drive a compressor. There is still a bill to be paid for heating the house, but what is purchased is the electrical energy necessary to transfer heat aiready existent to a place where it will be useful.

In some installations, heat is extracted from the water in a well near the house, which would normally be warmer in winter than the atmosphere.

Improvements are being made in the circulating systems for both hot water and steam as well as for hot air. With the use of small electric pumps, a quicker response to demands for more heat is possible. Smaller boilers, pipes, and radiators may also be used when the heating agent is rap-

Heating characteristics are checked by means of thermocouples at various heights. The stove is mounted on a scale to show loss in weight as coal is consumed, Below is the new Servel gas-fired winter-and-summer air conditioner that works on the principle of the gas-operated refrigerators. It is ready for postwar houses

idly circulated. Only one main pipe is needed to carry water to radiators and back when special valves are installed throughout the system to give each radiator its proper share.

A large variety of thermostata will be offered for efficient control of heat both in the newly installed and existing systems. Some are designed to give zone control, that is, a different temperature in different parts of the house, such as the living room and dining room, kitchen and service section, and the sleeping quarters. This requires several thermostats actuating valves in various parts of the system. Another idea is an outside thermostat that anticipates the need for more or less heat before a change in weather is felt inside the house.

One method of heating homes that was gaining favor before the war is panel or radiant heating, which does away with radiators and registers and makes use of a network of pipes laid under the floor, or even in the walls or ceiling, if preferred. The radiating surface is so large that hot and cold spots in a room are eliminated and the transfer of body heat to cold walls is materially reduced. Radiant heating may be used with any type of fuel or furnace.

Something entirely new in home-heating plants may come from wartime development of small, extremely efficient heating for stratosphere warplanes. The fuel now used is gasoline, but the same heating principle is being tried with gas and fuel oil. An electric motor drives air through the unit at high velocity

Solar heating as a supplement to furnace heating is a method of at least cutting down on the fuel bills. All that is necessary is a great deal of glass on the south side of the house. With the development of insulated glass consisting of double panes enclosing a dead-air space, this method becomes still more practical, since the insulation provided prevents the escape of heat from the house while still allowing it

to enter. This may seem impossible at first glance, but actually the sun's rays, which are radiant heat, penetrate the insulating glass, while heat convection to the outside from within the house is blocked. Wide eaves are required with this type of construction. They must be designed to admit the sun's rays during the winter when the sun is low in the sky, but to intercept them in the summer when the sun is high.

Infrared electric lamps have been talked of also for home heating, but their use is best as a substitute for the familiar reflecting heater that warms local areas.

# 14 JUNETRET OF THE ELEMENTS

### By KENNETH M. SWEZEY

/HEN hydrogen gas is burned in air, the reaction of fire magically produces water! Ordinary water that we drink or bathe in is nothing but an oxide of hydrogen --- H.O. the commonest formula in the catalogue of chemistry. The name hydrogen

Itself means "water producer."

Although seldom found free, hydrogen is an important and abundant element. It constitutes one ninth of the weight of water and two thirds of its volume, and it is present in all acids and bases. Compounded with carbon, it forms a vital element in all animal life and plant life and in most substances produced by them. It is present in all natural-gas and petroleum products. Flames of incandescent hydrogen a third of a million miles high have been known to burst from the sun's chromosphere.

Pure hydrogen is invisible and odorless, and it is by far the lightest of all elements. Its lightness would make it the most efficient gas for dirigibles and balloons except that it is dangerously inflammable, and for

this reason the next lightest gas, inert helium, is used instead where it is available. Mixed in a blowtorch with oxygen, hydrogen makes one of the hottest flames known, Bubbled through liquid oils in the presence of a catalyst, hydrogen changes them into solid fats employed in cooking and soapmaking and for lubricants (see P.S.M., Jan. '43, p. HW 504).

That water contains 2 parts hydrogen and 1 part water can be shown by decomposing water in apparatus that can be set up in a few minutes. Invert two large test tubes of water in a large glass dish of water in such a way that the test tubes will contain no air. Then connect three or four dry cells in series to supply current to two carbon electrodes (they may be taken from flashlight cells) mounted so one projects upward into each tube. That part of the wires below water should have a sealing-wax or paraffin coating to protect them from electrolytic action. The water is made conductive by stirring in 1 part sulphuric acid for each 15 parts water after the apparatus

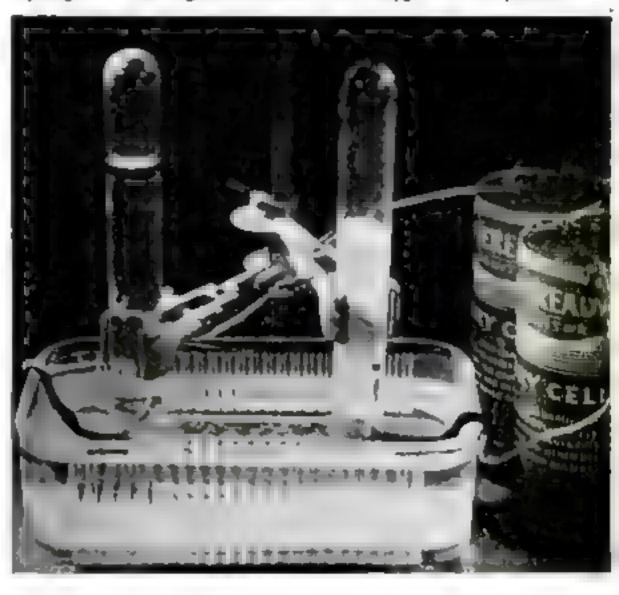

has been set up as shown in the photo below.

As soon as the battery is connected, gas bubbles will pour up from the electrodes, displacing water in the test tubes. Those from the negative electrode will be tiny hydrogen bubbles rising rapidly, while those from the positive side will be large bubbles of oxygen produced less frequently. It will be easy to see that the hydrogen formed is twice the volume of the oxygen.

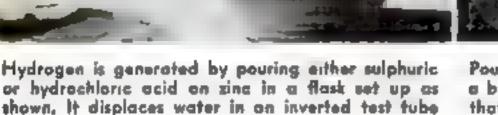

When the hydrogen test tube has been completely filled, it may be removed, still inverted, and a match applied to the open end. The gas will burn quietly with a hot blue flame.

A much easier way to produce quantities of hydrogen in the laboratory, however, is to displace it from an acid by means of a metal. Diluta hydrochloric or sulphuric acid and zine are generally employed. Use mossy zinc or zinc scraps from an old battery, since acid does not act rapidly on pure zinc, and cover a small handful of the metal with water in a 250 or 500-ml. flask. You may add a few drops of dilute copper sulphate to aid the reaction, [Turn the page.]

To show water is 2 parts hydrogen and I part axygen, current is passed through water containing a little sulphuric acid to free hydrogen at the negative electrode and axygen at the positive

Poured upward from a jar into a container balanced on a beam, hydrogen demonstrates its buoyance by lifting that side of the balance. It is the lightest of gases

The flask should next be stoppered tightly with a two-hole stopper through which are pushed a bent delivery tube and a thistle tube that reaches below the surface of the water. Connect the delivery tube with another bent tube leading below the water in an improvised trough, as shown in the photo at the left above

Then generate your hydrogen by pouring concentrated acid carefully through the thistle tube until a vigorous reaction with the zine begins. CAUTION: If more acid is added later, be sure no air bubbles are carried down the thistle tube, or, better still, don't add more acid!

To catch the hydrogen gas, fill several test tubes or jars with water and invert each in turn over the water trough, for hydrogen is collected by upward displacement. Let the gas bubble into the tubes until the water is completely displaced. As

each is filled with gas, take it from the trough still inverted, slip a glass plate over the mouth, and leave it inverted.

You can demonstrate the lightness of hydrogen with a simple balance made of sticks and wire. Suspend a large cardboard container open-end down on one end of the balance beam and balance it exactly with weights on the other end. Then turn a jar of hydrogen up under the cardboard container. The gas will rise and lift that end of the balance beam.

Although hydrogen burns readily in air, it will not support combustion, as can be shown dramatically with a jar of the gas and a match. Support the jar upside down on a clamping stand or with tongs to keep from burning your hands, and introduce into the opening a lighted match held in the end of a glass tube. The gas will light at the mouth immediately, but the match itself will be extinguished if pushed well into the jar. Withdrawn again, the match will be lighted by the flaming gas at the mouth.

Hydrogen is highly explosive when mixed with air, and for that reason it is imperative that it be handled with care. Read carefully and always follow the precautions on the facing page. After that you can burn hydrogen in air to prove that it produces hydrogen exide or, in common words, plain water. Connect a drying tube containing anhydrous calcium chloride to the delivery tube of your hydrogen generator, and to the other end of the drying tube connect a bent glass tube drawn out on its

free end to a jet.

Never attempt to light the gas from the jet until you have tested it to make sure the hydrogen is unmixed with air. To do this, connect a rubber tube over the jet, lead it to the water trough, and collect a test tube of the gas as before. Ignite the gas in the test tube, and if it burns quietly it is safe to light at the jet. But if it explodes even slightly it contains air, and the jet must not be lighted until more gas is generated to force out the air and another test tube of it is tested. A further safety measure would be to wrap the generating flask loosely with a towel to catch the pieces of

Toy balloons can be inflated from a bottle of dilute acid and zinc. Hydrogen is here passed through a drying tube

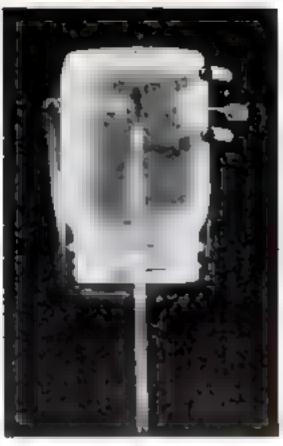

To prove that water is made by burning hydrogen, hold a sold tumbler over the flame. Water condenses on the inside

Bring a lighted match up to a jar containing hydrogen, and the gas will ignite . . .

... but push the match inside and its flame will be put out although the gas still burns

glass if the flask should accidentally break

After the gas has been proved pure, light

the let. If a metal or coronic let is used

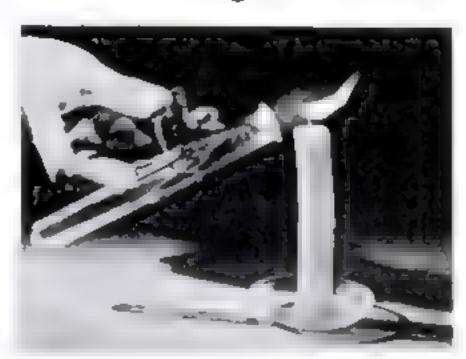

the jet. If a metal or ceramic jet is used, the flame will be an almost invisible blue. A glass jet may impart a yellowish tint because of the sodium in the glass. Now hold a cold tumbler or beaker over the flame, and drops—which can be shown by tests to be pure water—will collect inside.—

If you would like to show the remarkable lifting power of hydrogen and inflate toy balloons with it, a special generator for the purpose can be made by fitting an ordinary 8-oz. bottle with a one-hole stopper into which is pushed a drying tube containing

calcium chloride. Put a few pieces of mossy sinc in the bottle, cover them with dilute bydrochloric acid (about 1 part acid to 4 parts water), and add a few drops of copper sulphate solution.

Tie a balloon to the open end of the drying tube and hold the stopper to keep it from popping out while the balloon is being inflated. When you remove the balloon, the its neck to prevent the gas from escaping A small balloon will lift itself and at least several paper clips. The approximate lifting power of the gas is about 12 grams per liter since hydrogen weighs 0.09 grams per liter and air 1.29 grams.

### Danger-HIGH EXPLOSIVE!

MIXED with air, hydrogen is dangerously explosive, but it is an interesting and important gas made in all school and most home laboratories, and it is absolutely safe when handled properly. Accidents from bydrogen explosions are almost invariably caused by carelessness, and they are inexcusable. If you learn the following simple

rules and observe them faithfully, you will never have cause to worry.

 Don't generate large quantities of the gas. A 500-ml, flask should be the largest used in a home lab.

2. Make all connections gastight.

 Never ignite hydrogen issuing from a generator until a sample collected in a test tube has been burned with a quiet flame.

4. At other times, never allow a flame near the generator.

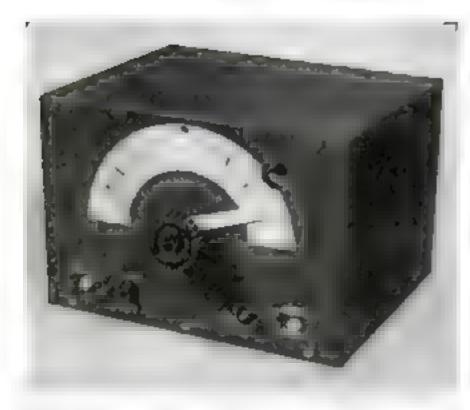

5. It is best not to add a second charge of acid to a generator. If you must, be sure no air bubbles are carried through with the acid.

 To prevent a flash back, extinguish a hydrogen flame with a piece of wet paper or a wet cloth.

7. Don't try to produce hydrogen-air explosions in anything but a test tube or other small straight-sided vessel.

8. Wrap the generator loosely with a towel to catch glass if it breaks.

### T.R.F. RECEIVER HAS

Housed in a trim cabinet, the original receiver had an extra input enabling it to be used with an FM typer. A tuning eye is located beside the dial

### By JOHN CAMPBELL, JR.

and a tuning eye with excellent fidelity, this tuned-radio-frequency receiver will give top-notch local reception when connected to a good amplifier. It will not tune with the critical sharpness of a superheterodyne, but is selective enough for all ordinary purposes. For use with a high-quality A.F. amplifier, or a high-fidelity woofer-tweeter system, the T.R.F. circuit is hard to beat. Whereas superheterodyne receivers can be made to give high fidelity only by elaborate and critical adjustments,

this T.R.F. circuit is simple enough for the beginner to assemble.

Aside from the tuning eye, the circuit requires only three tubes. It can be connected to draw its power from the audio amplifier used with it, or may be built with a separate power pack. The hookup shown uses standard 6-volt tubes; if others are substituted, condenser and resistance values may have to be revised to suit.

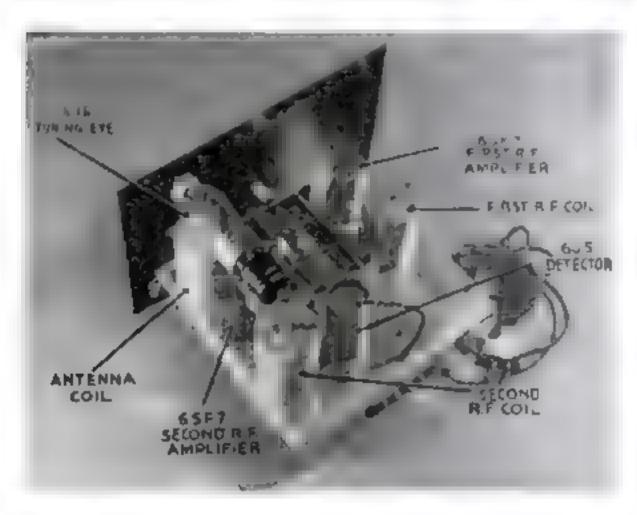

A straightforward two-stage T.R.F. amplifier is followed by an infinite-impedance detector, which gives excellent quality without loading the tuned circuits. The 6SF7 tube used as the second amplifier is essentially a pentode identical to the 6SK7, plus a detector diode. This diode is condenser-coupled to the plate of the pentode section to generate the A.V.C. voltage. Since the plate coil section of an R.F. transformer is not tuned, the diode load does not appear on the tuned circuits.

As shown in one of the photographs, the antenna coil, which feeds into the grid of the 6SK7, is across the chassis from it. The first R.F. coil, which feeds into the 6SF7 grid, is across the chassis from this tube, but next to the 6SK7, the plate of which feeds into it. This is sound layout practice. The grid of the 6SK7, as shown in the drawing, is connected to the stator plates of the tuning condenser. Gang condensers have connecting lugs on both sides of the stator frame, so the grid end of the antenna coil is connected by a very short lead to the stator lug on that side, and the 6SK7 by another short lead to the stator lug on its side of the chassis. The same is done with

the first R.F. coil and the 6SF7. Thus the stator plates constitute most of the grid leads. Because the coil associated with each plate circuit is near the tube involved, plate leads also can be kept to minimum length.

Keep all other R.F. leads as short as possible and well protected from each other to avoid excessive feed-back. It's a good trick to use bright-red hookup wire for them, and to place the various by-pass condensers so that they will help block feed-back.

Parts are loid out to minimize R.F. feed-back. All coils are shielded. Both plate and heater current is drawn from the A.F. amplifier used with this tuner

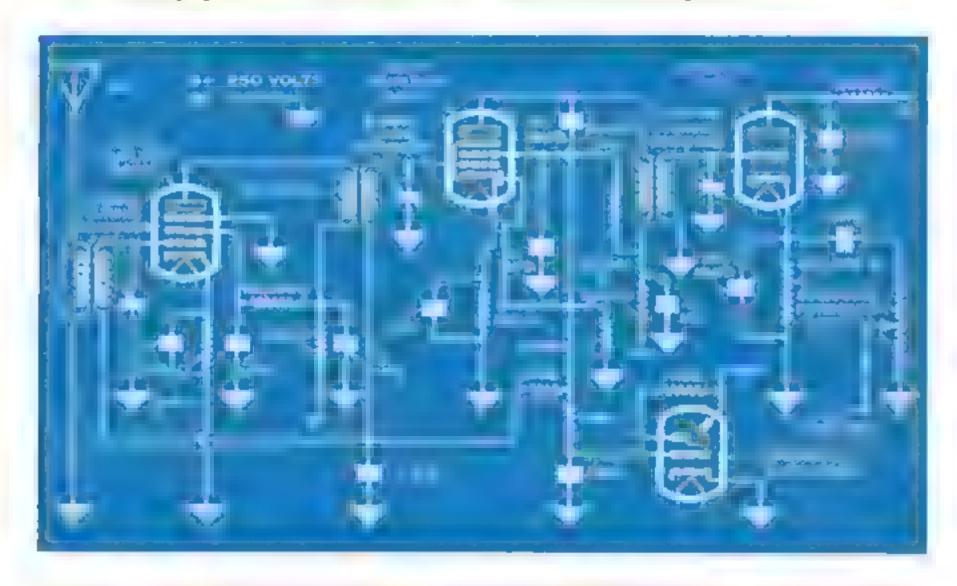

### AUTOMATIC VOLUME CONTROL

Slight feed-back can be tolerated and is even desirable. When plugged in, the act should be somewhat "busy" with no station tuned in, since a very small feed-back tends to greatly increase sensitivity and improve selectivity. But do not expect critical tuning; the circuit is intended for high-fidelity reception, and must therefore pass the full 10,000-cycle band width of the transmitter with nearly uniform response.

In selecting parts, be sure to use a

matched set of antenna and R.F. coils. Otherwise a slight difference between them might mean, for example, that with the antenna circuit tuned to 1,100 kc., the first R.F. stage might be tuned to 1,050 and the second to 1,200 kc., even though all trimmers were adjusted so that the three circuits tune simultaneously to 1,500 kc.

A short indoor serial will suffice for local reception. With an outdoor serial, selectivity will be somewhat poorer.

### CHOOSING RADIO RESISTORS

[ELECTRICAL]

A common means of reducing voltage at a desired point, or of limiting current draw to a safe value, is to insert a resistance in the circuit. This is usually connected in series with the power source and whatever device or apparatus is to be so controlled

Two conditions must be met in choosing the right resistor: it must have the correct resistance to cause the required voltage drop, and it must have enough current-carrying capacity to remain reasonably cool in operation

The resistance is calculated by the formula R = E + I, where R is in ohms. E in volts, and I in amperes. If the current is in milliamperes, R will be in thousands of ohms.

EXAMPLE: A resistor is needed to drop a 300-volt plate supply to 100 volts for the screen grid of a 6SA7 tube. Thus 200 volts must be dropped across the resistor. A tube manual lists the screen-

grid draw as 11 milliamp. Dividing 200 by 11 yields 18, which being in thousands of ohms indicates a resistor of 18,000 ohms. In practice 20,000 ohms would be close enough.

The necessary current-carrying capacity or wattage rating is given by the formula W (watta dissipated as heat) =  $E^{\gamma} + R$ . Squaring the voltage drop (200 X 200  $\simeq$  40,000) and dividing by the resistance (18 000) gives 2.2 watta; however, if we use a 20,000-ohm resistor, it need be rated at only 2 watta.

EXAMPLE The screen of an RF, amplifier tube that draws 2 militamp, is to be supplied with 180 volts from a 300-volt source. The voltage drop across the resistor must therefore be 120 volts. Dividing 120 by 2 gives 60, which again is in thousands of ohms. Squaring the voltage drop (14,400) and dividing by resistance (60,000), we find the resistor should be rated at ,24 watts.

# radio ideas

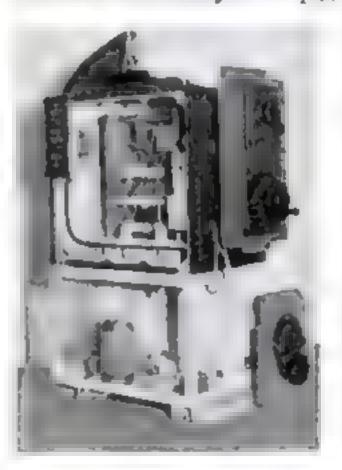

WALKIE-TALKIES have been experimentally used on the golf course, where they have proved successful in transmitting play-by-play accounts of tournaments, thus indicating a possibility of postwar use by golfers and others who would like to keep in touch with their homes and offices. The light-weight radio with attached antenna shown at the right was built by Motorola and is similar to the walkie-talkie used on the war fronts by the U.S. Army Signal Corps. Many improvements in this type of equipment have resulted from the war.

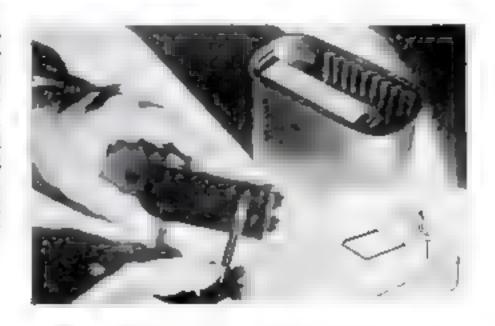

THIS MIDGET RADIO in a plywood cabinet measuring 3" by 6" by 6" was built of parts salvaged from junk heaps by 8gt. Donald Develder, of Rochester, N. Y., a member of the Coast Artillery Command stationed in the Panama Canal Zone. It has two tubes, plugs into the usual wall receptacle, has a trailing antenna, and weighs 3 lb. Eight holes in the front plywood panel let the sound through.

QUICK ADJUSTMENT OF FREQUENCY without loss of stability permits radio operators in the U. S. Navy to handle thousands of messages over a large number of channels and so escape jamming by the enemy. One frequency generator responsible for this great stride in radio is the invention of a Navy officer, Capt. J. B. Dow, and is known as the Dow electron-coupled oscillator. It combines the stability of the quartz crystal, one of which

has previously been required for each "fixed" frequency, with military requirements for a transmitter that can be quickly tuned to a number of frequencies. The Dow tuned circuit accomplishing this is really two inductance-capacitance circuits, one connected to the screen grid of a tetrode and the other (tuned to twice the frequency of the first) connected to the plate. They are coupled only by the electron stream between the grid and the plate.

VACUUM-PACKED BATTERIES, four to each container, are filled for use simply by puncturing the casing with a special tube that permits the vacuum to suck in the electrolyte, as shown in the inset at the right. The batteries, three rated at 36 volts and the fourth at 6 volts, are provided with 18 vent holes each, one hole for each cell, to receive the electrolyte. They were developed by the Willard Storage Battery Company for the armed forces.

### When Fighters Turn Bombers

(Continued from page 125)

but Rommel soon began escorting them with barges on which were mounted clusters of 88's. The barges would flank the supply ships, where the masthead bombers couldn't get at them with their strafing, and after the boys had tossed their bombs, the 88's opened up on them going away. "They cut their fuses to as little as 300 feet," one of the pilots says. "We got their ships, but they got our planes." That one was solved by sending over medium bombers and fighters just ahead of the masthead attack; they came in at medium altitude and strafed and frag-bombed the barges. Then the masthead boys came in and did their stuff.

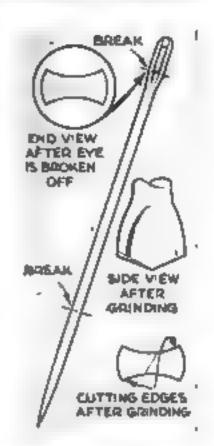

Out in the Pacific, however, our fiyers discovered a hazard in their own bombs. Working below treetop level, they found that the bombs now and then would bounce as high as the plane on their first jump, and occasionally a plane's tail assembly was damaged. That was one reason why they took the skip out of skip bombing: they learned to flip the bombs onto the target directly, instead of bouncing them onto it.

That problem also was a factor in developing the parachute bomb; and it led, eventually, to what the boys call glide bombing Glide bombing comes indirectly from dive bombing, but it is done with faster and bigger ships. It starts from 10,000 feet or higher, where the glide bomber noses over and heads for his target. His dive is at an extreme angle, and he sights on his target with the nose of his ship. But, unlike the dive bomber, he releases his bomb or bombs at about 2,500 feet, pulls out, and gets away. Properly done, glide bombing is extremely accurate, and the head-on ship presents a minimum target to antiaircraft guns.

The glide bombers use standard bombs. Down in the Pacific they also used, in some campaigns, lots of beer bottles. Any empty bottle makes a shrill whistle as it falls through the air. Bend a razor blade into its neck and it fairly screams. Some types of bombs make a noise very much like that of a bottle. So the boys took along a case or two of empty bottles, particularly when attacking Jap airfields. They dropped bottles and bombs together. And the Japa spent days looking for time bombs-that's what they thought the bottles must be. Just to encourage them, our pilots began dropping a few time bombs, too. The results were altogether satisfactory. A couple of 500pound bombs, a case of beer bottles, and half a dozen small time bombs would immobilize a Jap nirfield for days.

### Twist Drill Made From Needle

IF You break your last small twist drill when you are in the middle of a job, and if purchasing a new one is inconvenient, you can make a substitute from a small needle Break off the point and the eye, as shown. Grind down the upper or head end of the remaining piece to form two cutting edges. Chuck the shank in a hand drill. The drill thus made will be found to have good side clearance.—CPL JOSEPH A. DESBIENS.

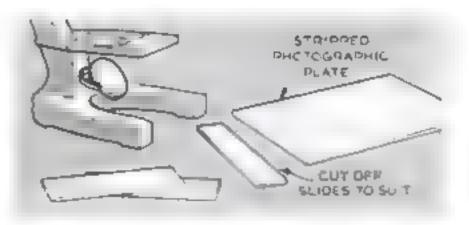

### **Brush Cleans Typewriter Type**

INSTEAD of discarding a typewriter eraser-brush when it wears out, you can make # over into a type cleaner, similar to the one shown at the left, by cutting the bristles to about " in length. They will then be stiff enough to be used for flicking out the lint and other matter that might, if left in the type, make the copy extremely difficult to read.—J. WELSH.

### Easily Made Microscope Slides

PHOTOGRAPHERS generally have on hand some old glass photographic plates. The excellent, flaw-free material from which these are made is ideal for microscope slides. Soak them in hot water to remove the emulsion; then cut them into strips that are of the proper width to fit on the stage of your microscope.—Louis Chikey.

### When Plane Cabins "Explode" (Continued from page 156)

The doctors know, now. They have experimented with "explosive decompression."

Scores of men have been subjected to it, some of them at simulated outside altitudes of 50,000 feet with the inside pressure pumped up to 40,000. In a fraction of a second they have been catapulted from a pressure of 2.7 pounds to the square inch on their bodies (the pressure at 40,000) to 1.7 pounds (the pressure at 50,000). They have been exploded from 10.1 pounds to 3.55 pounds. That is equal to being shot from an altitude of 10,000 feet to one of 35,000 in less time than it takes to draw a breath.

And these are the findings:

At most sititudes, explosive decompression will have no ill effects.

At extreme altitudes it can produce serious effects.

Unofficially, a corollary finding can well be that limitations on what the body can stand may establish an altitude beyond which human beings cannot engage in air warfare in pressurized compartments.

Experiments in explosive decompression were begun in the spring of 1945 when the Twentieth Air Force, employing the pressurized-fuselage Bosing B-29 Superfortress, was only in the planning stage. An Army major, H. M. Sweeney of the AAF Materiel Command, undertook the work. Lower simulated altitudes in airplanes flying at high altitudes meant, of course, greater crew comfort and efficiency. Above 30,000 feet, airmen had to breathe pure oxygen to stay alive. Above 40,000—if operational altitudes ever went that high—they had to breathe pure oxygen under pressure because the outside air pressure was insufficient to force it into the thoracic cavity.

Sweeney was his own guines pig.

On the meager evidence at hand, and pending an accumulation of more precise information, the Aero Medical laboratories instructed the Materiel Command's aircraft and power-plant laboratories to stress the B-29 fuselage and build the pressurizing equipment tentatively for a pressure differential of 6.55 pounds to the square inch. The aircraft laboratories express that as "PSL"

Air at sea level is heavy. Every square inch of the body has 14.7 pounds of air weighing on it. At 60,000 feet the weight is only 1.1 pounds. So a pressure differential of 6.55 PSI at 30,000 feet would mean a pressure inside the airplane of 6.55 plus 4.4 (the pressure outside), or 10.95 PSI. For the crew that would be a simulated altitude of about 8,000 feet. A pressure differential

of 6.55 PSI at 35,000 would mean a pressure inside the plane of 10.1 PSI for a simulated altitude of 10,000 feet.

Sweeney knew he was dealing with some highly critical factors in explosive decompression. One was aeroembolism, in which nitrogen comes out of solution in the blood, collects at the joints, and induces excruciating pain. Another was expansion of the internal body gases. In an explosion from sea level to 40,000 feet, for instance, those gases would set up an expansion rate of 110 times a second.

Equipment was meager in the beginning. A flying suit, in which pressure could be built up and suddenly destroyed, was used. Sweeney donned it and exploded himself in a low-pressure chamber at modest differential pressures up to 35,000 feet. X-ray pictures showed that his body had suffered no damage. The tests were pushed to 45,000 feet—using, however, a differential of only 2.75 PSI to ward off the bends.

Apertures of different sizes were used to govern the time in which the pressure was lost.

When the pressure suit outlived its usefulness—it could not hold a 6.55 PSI differential—Sweeney borrowed a mockup of a P-36 fighter cockpit from the Lockheed Aircraft Corp. Gradually pressures were built up as the mockup gained "altitude" in the pressure chamber. When a 6.55 PSI differential was used at 35,000 feet with a 12-inch explosion opening, decompression occurred in 75/1,000 of a second. The expansion of body gases amounted to 3.5 times at a rate of about 47 volumes a second.

Sweeney successfully tried a 7.5 PSI differential to simulate an 8,000-foot attitude at 35,000 feet and one of 1.5 at 50,000 feet, using an opening as big as 26 inches in diameter. The explosion from an opening of that size simulated what would occur if enemy gunfire or flak destroyed the newtype "bubble" canopy on fighter planes.

Other subjects followed Sweeney. He and some of his colleagues, including flight surgeons attached to the Twentieth Air Force, were exploded at extreme altitudes in 8/1,000 of a second. Bad effects began to appear. Several cases of "bends" of rapid onset occurred. The subjects fumbled when they tried to adjust the pressure-breathing regulator. It was a bit too much for the body to take.

Maybe an extreme height exists beyond which ordinary man cannot venture. Maybe Major Sweeney has drawn a red line on high-altitude military flying.

### "Get Good With the Grenade" (Continued from page 117)

grenade with a laminated-paper body also was produced. It was eafer to use in the open than the Mills type, which had been designed as a defensive grenade to be thrown from cover, yet our fighters preferred the more powerful fragmentation grenade. The AEF also was supplied with a number of types of smoke, incendiary, and gas hand grenades.

The British continued to use rod-type rifle grenades throughout the war, but two French experimenters, Viven and Bessieres, produced a superior weapon which we adopted, and which, in slightly improved form, we are still using. This "V.B." grenade la fired from a short, cylindrical discharge cup, or tromblon, which slips over the muzzle of the Springfield rifle. The grenade is a cylinder of maileable fron, two inches in diameter and 24 inches long, notched on the inside to insure fragmentation. It weighs a little over a pound. A. tube, large enough to allow free passage of the rifle bullet, extends through the grenade: on one side of it is the fuse assembly. A atriker extends obliquely over the end of the bullet tube. When the rifle is fired, the bullet hits the striker, causing it, in turn, to hit the primer. This ignites a fuse that is timed to set off, at the end of the grenade's flight, a detonator that explodes the highexplosive bursting charge. The gases following the bullet out of the rifle barrel propel the grenade from the discharger. The normal range is up to about 300 yards and the effective radius of the burst about 30 yards.

In World War I the rifle grenade was used extensively to produce harassing fire in trench fighting, for close-in defensive barrages, and for other purposes. Some years ago, after our development of the 60-mm. mortar, which fires a 2¼-pound projectile, our Army discontinued use of the rifle grenade as a weapon against personnel and other unarmored targets. The Marines continued to use the V.B., which, during the current war, has been highly effective in jungle fighting.

Our present fragmentation hand grenade was developed from our World War I adaptation of the Milis grenade. Instead of a high explosive, its bursting charge is grained E.C. semicolloided nitrocellulose powder. This substitution eliminates, without loss of effectiveness, the need for a detonator, and permits the shipment of grenades complete with their fuses. The cast-metal, lemonshaped body, 2½ inches in diameter and 4½ inches long, is grooved like a waffe to insure good fragmentation. The fuse as-

sembly is screwed into the top of the body. The firing mechanism is a hinged steel striker actuated by a spring and held in position by a lever which extends downward along the grenade body. A safety pin, with a ring attached to it, extends through the lever and secures it to the body. Just before the grenade is to be thrown, the safety pin is withdrawn, the lever then being held in position against the grenade body by the thrower's band. When the grenade leaves his hand, the lever flies off and the pressure of the spring rotates the striker around its hinge pin and causes it to hit a primer that is almost noiseless. The primer lights a fuse which, after burning for five seconds, fires the ignition charge of black powder. This, in turn, sets off the bursting charge,

Our method of throwing grenades has been improved as much as the grenades themselves. In World War I we adopted the Britishers' straight-arm overhand "cricket swing," which almost all baseball-experienced Americans found both unnatural and ineffective. The throwing motion our GI's are taught now is like a catcher's peg starting from a shot-putter's stance, "According to the book," a crawling bomber must rise to his knee before throwing his grenade, but Jap suipers have forced a modification of this rule, and our men have devised several ways of throwing accurately while flat on the ground. One of them is to lie on your back, use your arms to pull yourself into the position from which you want to throw, and then stretch up your arm and throw as you do a half-roll toward the target. "Better get good with the grenade," is the advice being sent home from the Southwest Pacific. "It pays in the jungle!"

Grenade throwers in the open are drilled to drop to the ground after each throw. This is a necessary precaution because the effective radius of the fragmentation grenade is so large that the thrower is in serious danger of being injured by his own weapon. An offensive hand grenade is issued for use in the open. It consists of a half pound of pressed TNT in a cardboard, fiber, or plastic body, and is equipped with the same fuse as the fragmentation grenade. Its concussion effect is dangerous over a seven-yard radius. It is very effective for the demolition of emplacements, but when our fighters go hunting Japs they prefer the more powerful fragmentation grenade.

Smoke and incendiary grenades also are issued. Smoke grenades are tin cylinders 214 inches in diameter and about five inches long filled with a smoke-producing composi-

tion and equipped with short-delay fuses. Incendiary grenades usually are pint-size glass bottles filled with a gasoline-base inflammable liquid, with an igniter taped to the outside of the container. There also are thermite grenades that have tin-plate shells; and a sticky grenade whose rubber-gasoline mixture ignites spontaneously when the bottle shatters on its target.

The success of German tanks in 1940 created a demand for an infantry weapon light enough to be carried and fired by an individual soldier and powerful enough to penetrate the armor of modern tanks. Our Army Ordnance Department met this demand with our new antitank rifle grenade, which at moderately short range is capable of penetrating and destroying any known enemy light or medium tank.

This grenade is fired, by means of a special blank cartridge, from a launcher clamped to the rifle barrel. The launcher, a steel tube forming an extension of the barrel, has rings milled into its outside surface. The grenade, which weighs about 1 ½ pounds and costs two dollars, is a cylindrical sheetmetal shell loaded with a powerful high explosive and provided with an impact fuse. Its tail section is a vaned hollow tube that fits over the rings of the launcher. Two models of the antitank grenade are used: one with a fuse that detonates only on

impact with a hard, resistant body; the other with a more sensitive fuse that functions upon impact with soft earth. Both models are used by the Army and the Marines.

Another of our rifle grenades is basically the fragmentation hand grenade, with an impact-type fuse and provided with a vaned tail assembly similar to that used with our antitank rifle grenades. We also have an ingenious grenade adapter which permits the use of the fragmentation hand grenade as a rifle grenade.

The Springfield rifle is commonly used for firing antitank grenades, and one man in each infantry and Marine rifle squad is armed with it for that purpose. A butt rest may be used, or the rifle may be fired from the shoulder—although the recoil is heavy. Ordinary ball ammunition may be used with the launcher—but not with the grenade—in place. Similar launchers made it possible to fire rifle grenades with both the Garand and the 5½-pound carbine, with which a large proportion of our soldiers now are armed.

The Germans developed grenade projectors in 1916. Present Nazi and Jap models are similar to light mortars. Newest development is the British "Piat"—a 33-pound launcher that projects a 2½-pound antitank bomb 350 yards.

### Winning the War on Rust (Continued from page 250)

ture off of the metal, will not corrode even though left in the humidity cabinet for hundreds of hours. Many manufacturers of easily corroded precision parts now insist that these parts be coated with fingerprint-removing oil the instant they are finished.

Bpecial oils may be used to remove immense quantities of moisture from machinery. Water does not cause much rust unless oxygen is plentiful in its vicinity. As you descend into the sea, the amount of oxygen in the water diminishes rapidly. Many parts of sunken ships, consequently, may not rust seriously. But when the ships are lifted to the surface, the water clinging to the metal is brought into the presence of the oxygen in the air. Rusting may then occur almost instantly if the metal is not quickly dried. This now can be done with oil.

When the Normandie was raised, much of its machinery was saved by promptly spraying, swabbing, and bathing it with rustpropting oil. Even though the liner had been submerged for months, only two parts of its delicate and complex gyroscope had to be replaced. Similar oil was applied to

the machinery of the submarine Squahas, which was later recommissioned as the Sailfish. The success of the salvaging operations at Pearl Harbor is credited partly to the use of oil containing rust inhibitors.

The U.S. Navy is also using antirust oils to protect inactive ships. In addition, such vessels may be dehumidified by mechanical drying machines. Six of these machines are being used on an experimental ship. Each drier contains two beds of silica gel or activated alumina to take moisture out of the air. Electric heat dries out each bed when it becomes saturated with moisture.

Improved rustproofing techniques will help raise the whole world's standard of living. Manufacturing losses may be reduced; sunken ships may be salvaged more successfully; weapons need not grow rusty for lack of use; international commerce will be facilitated, and metal can be made to do more of men's work for them even in the most unfriendly regions of the earth. For the development of rust-inhibiting oils brings men one step nearer to victory in the struggle to keep the things they wrest from nature.

fect on the way that currency paper burns.

But these clusive clues are studied only when the serial number (the colored number of eight digits preceded and followed by a letter) or the face-plate number and check letter cannot be identified. The face-plate number is the very small black number above or a little to the right of the Secretary's signature. It indicates the number of the twelve-subject plate from which the note was printed; the check letter, which precedes it and is repeated in the upper left-hand corner, indicates the position of the individual subject on the plate, as follows:

A	G
	H
Ć.	1
D	
E	K
F	L

As a result of this system, the number of possible check letters can by mathematics be reduced from 12 to two, for any given serial number, since the notes are consecutively numbered, beginning with 00000001. Divide the serial number by gix. The remainder has two corresponding letters (numerically) between A and L. Notice that an odd remainder calls for an "odd" check letter, zero being considered even. Consequently, when a fragment is found bearing a check letter D, for example, it cannot be part of a note the serial number of which yields an even remainder when divided by six; conversely, if the remainder is four, then only check letters D and J can belong to the note in question.

While with pencil and pad I was verifying this, Mrs. Walker took an envelope from the desk drawer and produced an oblong paper on which fragments of char had been assembled into the shape of a nearly complete note. The burned paper was a solid, unembellished black.

"Speaking of the way paper burns differently," she said, "just look at this. This isn't real bank-note paper, at all. There was some pulp in it. It's a counterfeit \$20 Federal Reserve note."

Amazed at such uncanny deduction. I stood for a moment blinking, and then exclaimed, "You mean you can tell that those ashes are . . ."

"Don't call them ashes," she interrupted emphatically. "They're not ashes; they're char. We can't do anything at all with ashes. People who send us ashes just waste their own time and ours. When you write your article, tell people not to send ashes."

Impressed by her earnestness, I later set about learning the difference between ashes and the charred fragments unrecognizable as one-time paper.

Currency paper is made of linen and cotton; both are cellulose, containing carbon, hydrogen, and oxygen. When cellulose is heated, toasted, in a space containing insufficient air to permit complete combustion (isn't all burned up, that is), hydrogen and oxygen (H<sub>i</sub>O) are driven off, leaving black carbon. When a bill is so treated, a wafer remains, coated with pigments of ink. That's char.

When currency paper is burned in a space with enough air to permit complete combustion, only a gray ash remains. It is composed of the noncombustible portions of ink and the mineral elements of the paper. This residue is worthless for purposes of reconstruction or identification. So don't send in ashes.

But at the moment, whether the reconstructed fragments were ashes or char seemed to be a matter of comparative unimportance. In either case, how could Mrs. Walker, without having made an analysis, tell that the remains were those of a counterfeit twenty-dollar note?

Her explanation, though no doubt lucid enough to one of her intelligence and experience, was completely beyond the writer's grasp. It was a consolation to realize, however, that the knowledge of bow to distinguish between counterfeits and good notes in their original state is more useful to the average citizen—and certainly more easily acquired. You can develop that knack simply by "knowing your money." Frank J. Witson, Chief of the United States Secret Service, trenchantly puts it, "The public's ignorance of its money is the counterfeiter's stock in trade." What it boils down to is a matter of comparison—the comparison of the suspected note with a genuine note. It is a story that can best be told graphically—in pictures, that is.

A large portion of the mutilated currency received for redemption comes in the form of char. After every large fire, shipments of burned notes can be expected. And with them nearly always comes a tragic tale. For example, there is the money from the Morro Castle. The scorched and battered strongbox that was taken from the sunken ship, after she burned near the New Jersey shore, reposes on a shelf above Mrs. Walker's desk. Again, there is the money received after disaster overtook a trans-

continental airliner. In June of last year, a thrifty housewife in Iowa stowed the family savings in a candy box and hid it in the chimney above the damper. On a chilly September morning her husband lit a fire. Three thousand dollars were burned beyond redemption—to ashes.

But while a great quantity of burned notes are redeemed, most of the money received for identification has been mutilated in other ways: money that has lain for months at the bottom of the sea; notes that have been chewed to bits; that have rotted into a compact mass; that have been hidden in pillowcases and under mattresses, and sent with the bedding, or in the pockets of shirts and overalls, to the laundry. It comes back so faded and blurred that you would think someone had replaced the genuine bills with counterfeits.

When you see the great number of securely capped iron pipes that have been used by money hoarders, you are apt to marvel that so many minds should think alike, or wonder if plumbers, especially, have an aversion to banks. But curious repositories for hidden wealth are legion. People hide their money in rusty cans, in fruit jars, in flashlights. They bury it in eyeglass cases and old shoes. They stuff it into automobile batteries, where it is eaten by the acid. They stick it in a bottle and hide the bottle in a swamp. In summer they stuff it in the furnace or let it rot in the damp coal bin. In winter they put it in the attic for mice to feast upon.

The titian-haired lady at the third desk of the second row is pasting on a piece of paper the amputated head of Andrew Jackson. Though numerous, most of the pieces are large.

"Termites," she said, smiling thoughtfully. 
"A man at South Bend, Indiana, hid \$6,000 in the rafters, where termites are the bills. 
This is an easy case." (A "case" is any shipment received, no matter how large or small.) "I wonder why it's all in twenties. 
Odd that there should be no fives or tens—just twenties."

She had been working on the case only two afternoons, she explained, in turning from the desk, and had already identified \$4,800!

The work of identification is very hard on the nerves, as it requires intense concentration and more patience than Job ever dreamed of having. Therefore, the ladies of the Redemption Section labor at it only during the afternoons. In the mornings they do their clerical work for "relaxation." This it would seem, is almost as trying, because a great many little details must be painstakingly recorded. Cases may be reopened many years after their original disposition. "If you're going to write a piece for a magazine," the titian-haired lady continued, "tell people not to use Scotch tape. It just makes it harder for us, and sometimes the evidence we're looking for is destroyed with the removal of the tape. It nearly always is with char. People shouldn't handle mutilated money, at all. They should send it along with everything in the container—except hard objects."

"Anything else?" I asked, making an entry in my notebook.

"Yes, here's another 'don't': don't send in the residue of an incinerator—bottle tops and garbage. People sometimes do. It's awful." She glanced at her wrist watch and returned to her work.

From a pile of debris her tweezers selected a small fragment with serrated edges. It was Andrew Jackson's scalp.

Money that is thoroughly rotted is definitely an unpleasant sight. Certainly the miserable remains of \$230 that had been taken from a buried shoe (time: April 14, 1944; place: Chicago) were a mess. The upper part of the shoe had completely disintegrated. Enough remained of the lower portion and the sole to reveal a cobbler's nightmars. The money itself defied deacription—that is, the portion of it now housed in a pasteboard box on the desk: rolls of organic matter that had been converted into some substance of stony hardness.

Yet the stony hardness yielded to the expert flugers. Fragments and strips of delicate tissue peeled off the compact bundles. If you can imagine one side of the Grand Canyon reduced to the size of a Brazil nut, and the paleozoic strate stripped off by a highly manicured fingernail, you will have an approximate picture of this sorceress's performance.

The fabulous amount of currency sent in for redemption does not all come from individuals or corporations. The millions—billions, in fact, as time passes—come through Federal reserve banks and fiscal agents. For the most part, these are wornout notes, unfit for further circulation. They are classified, tabulated, counted, recorded, and finally destroyed in the incinerator—an inferno hot beyond the conception of Dante—and reduced to ashes.

Ashes, indeed,

But all that is no concern of the Redemption ladies, who are the fairy godmothers of the shiftless, or careless, or overcautious, or simply unfortunate people whose money has become mutilated. They are our unknown friends, these ladies of the Treasury of the United States, Currency Redemption Division, Washington, D. C.

So don't send them ashes.

# ANTI-FREETE USERS

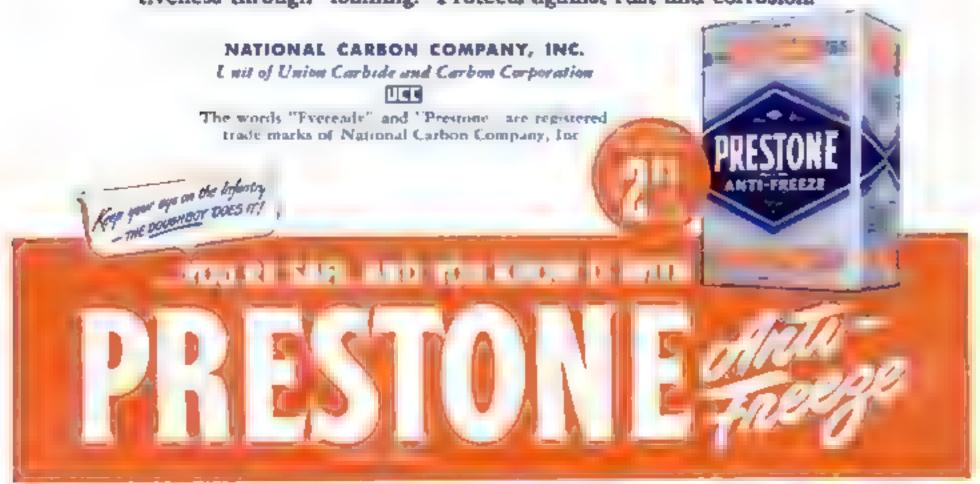

## is being distributed under W.P.B. Plan

THE ARMY, NAVY, AND LEND-LEASE are taking millions of gallons of "Prestone" anti-freeze. This leaves a reduced supply for civilian consumption.

The War Production Board, assisted by the Anti-Freeze Industry Advisory Committee, has worked out a plan of distribution of the available supply of all types of anti-freeze based upon a state allocation system. Under this plan there is every reason to expect that there should be enough anti-freeze to keep the nation's motor vehicles running this winter.

However, the chances are that "Prestone" brand anti-freeze will be rather scarce in many localities. Yours may be one of them. So, see your dealer early. Have that feeling of security that comes when you have the world's finest anti-freeze in the radiator of your car. One shot lasts all winter. It doesn't boil away, evaporate or lose effectiveness through "foaming." Protects against rust and corrosion.

# Home

Home is a lot of little things—the way you want 'em. A certain chair, and the ticking of a clock, the smell of what's on the more, your old hat, and good friends

And among these is a papeful of tobacco, and plenty of time to enjoy it.

Raywoodie Pipes are part of this picture. When the work is done, when the stugging is over, when you've sweat it out successfully, you'll have the finest pipe that money and experience and paint-taking care can produce. Kaywoodie promises you that

A Kaywoodie takes years to make, and it, we believe, the mild-

est, coolest, pleasantest form of smoking. This is due to the Kaywoodse Briar which comes from the countries surrounding the Mediterranean Sea (and only from there). You can't rush it, or mass produce it, or short-cut it. After it has grown, it has to be seasoned and mellowed, aged and tempered, so it will draw the goodness from tobacco, and yield a cool, smooth, delictous smoke...a smoke free from trouble, with the distinctive. 'Kaywoodie Flavor'

Yes, Kaywoodie is, and will be, one of the things worth while in your bone

silence, as if she were struggling for the words, "He wants to tell you to stay here. Do not go back home. He said, 'Don't worry about me. I am happy.'" Another pause. "You have pains," she moaned. "Pains here," and she pressed the hand with the envelope in it to her head, "Go see an oculist."

How she was able to read my questions through the envelope is explained in the drawings on page 68.

From this "church" we taxied over to see the medium whom I shall refer to as Dr. S. Here, with minor differences, we found the same kind of setup as at Laura's place. This time, however, instead of sealing our questions in an envelope, we were told to fold the slips of paper on which they were written. Dr. S. went through a hocus-pocus of holding each folded slip to his forehead while the "spirits" came through with the answers to the questions.

Miss Mackenberg nudged me "The old biliet-switch trick," she whispered. "Houding often exposed it."

The billet trick, Miss Mackenberg later explained to me, has numerous variations, but the elementary principle is the substitution by sleight-of-hand of a folded paper identical in appearance to the one on which the victim has written his question. How it is done is shown in the diagrammed drawings on page 71.

Since so many persons preceded us, our questions were not answered until very late. The meeting had opened at 7:45 p.m. The crowd must have changed at least twice before we got there. This would make the "take" for the evening over \$125.

Except for the fact that he brought a little old lady into my "scance," the answers were much like those I'd heard before. After quoting from the Scriptures, he shut his eyes and said: "I see, I see, I see—a little old lady, one who has passed away many years before, at your side. She saya, 'God bless you.' Yes, she knows Charlie. Neither one of them thinks you should return home. They are happy. They want you to be happy. Don't worry about those pains in your head."

Later, Mr. Proskauer told me that he had known these mediums and seen them operate over a number of years. "They are super confidence men and women," he said, "who trade with diabolic shownmanship on the sorrow of others. The same pattern is being repeated in every city in the United States. During and following every war, thousands of these mediums spring up. It

happens to be worse this time because the present war has been a long one and there have been many casualties.

"The one phrase, 'Consolation for the bereaved,' which these mediums use is the snare that is trapping thousands of relatives, wives, sweethearts, and parents of dead soldiers and sailors. Revealing the tricks these shysters use may save others. Professional magicians are particularly incensed because, to defraud others, the mediums are using the tricks which the magicians have spent years developing for entertainment."

The other tricks most frequently used to dupe the customers, Mr. Proskauer explained, are slate writing, table tilting, trumpet messages, spirit manifestions, and table rapping.

Slate writing is most convincing and uncanny, even to a magician or one versed in mediums' wiles, unless he is familiar with chemistry and physics. In one method the victim is handed two slates and a piece of chalk. He is then told to place the chalk between the two slates and tie or tape them together.

"The secret lies in the chalk," says Mr. Prockauer. "Seemingly nothing but an ordinary piece of chalk, which anyone may buy at a store, it really is pulverized chalk mixed with a little water, glue, and iron filings, molded and allowed to become hard

"The medium, after the slates have been sealed with the chalk between them, places them under his table. When they are out of sight, he brings out unseen a small but powerful magnet and traces with it the words he wants to appear. As he writes, the magnet pulls the chalk along noiselessly. The iron filings in the chalk nautrally follow the magnet, and while the writing is always somewhat shaky and spiritlike, it is always readable.

"Another method is to switch the slates with a confederate concealed behind curtains. The confederate does the writing and returns to the medium an identical pair of slates."

Table rapping usually is produced with an accomplice sitting at the table with the medium. Hands are joined, but in the darkness the medium releases one hand from that of her accomplice. She uses a hollow heel and hammer arrangement with a string running up to her garter. With her free hand, she simply pulls the string and produces the raps on the floor. It is almost impossible, in a darkened room, to tell from which direction the sound comes, particularly when the victim is keyed up.

Filing picks gut of propeller binds of Budd-built HB-1 transport piane.

Eveny detail in the maintenance of a costly giant of the air is important. Taking nicks out of a plane's propeller blade could be done—after a fashion—with a randomly selected file; but modern shop practice says, "No! Use the right file for the job." With Nicholson Files, that admonition can be obeyed. For smoothfiling aluminum and aluminum alloys (like airplane propellers), the specially designed Nicholson "Aluminum Type A" usually does the job best.

Hundreds of other filing jobs present similar tituations. "Know your files and get ahead" is today's advice to the forward-looking mechanic. Know Nicholson Files and your knowledge of file types will be up to the minute.

FREE BOOK, "FILE FILOSOPHY." It can give you more information about file kinds, use and eare in half an hour's reading than months of "apprenticing.". . . 48 interesting illustrated pages.

FILES FOR EVERY U.S.A.

The trumpet performance is a little more complicated. One method, repeatedly exposed by magicians, requires a small "gimmick." The trumpet itself is a metal cone about four feet long, painted black. On the mouthpiece end, the one the "spirits" use when they talk, is a wooden tip, turned to fit tightly over the metal.

Concealed about the medium's person is a round base of wood, which fits anugly into the wooden mouthpiece, like a cork in a bottle. When the lights are put out, she reads the questions, which have been laid face downward on the table in front of each visitor at the table, by using a "reaching rod." This is a contraption of collapsible tubing which, when opened, may be 10 feet in length. On the end of the rod is a pair of tweezers worked by wires running down the shaft of the rod. The medium picks the question up with this rod. The paper is slipped into the wooden tip on the base of the trumpet. This tip contains a small battery and a flashlight. The medium bends over the trumpet and reads the question inside. The light cannot be seen outside the trumpet. The trumpet tip is then removed. The medium places the now innocent trumpet to her lips and the other end near the victim, and in a diaguised, ghostly voice answers the question.

There are scores of tricks, depending on the ability of the medium. Spirit photography is a stunt in which the victim is photographed with the image of a loved one faintly outlined in the background. This is achieved by especially treated photographic plates or trick photography. Spirit manifestations in which the medium appears to exhude "ectoplasm," a wraithlike vapor, require expert manipulation. One famous medium, who was exposed, was found to be able to awallow yards of specially prepared cheesecloth and in the darkness to bring it forth from her mouth, creating the illusion that a spirit substance was emanating from her.

The multimillion-dollar racket thrives despite efforts of authorities to suppress it. Nearly everyone is a little superstitious, Will you light three cigarettes with one match? Are you careful what you do on Friday? The spook crook's golden opportunity lies in this human trait. One great asset they have, Mr. Proskauer explains, is showmanship.

"You go to see them," he says, "because you think there might be something in it. Step by step they build you up to an emotional climax where your reason loses control. Then they tell you the spirits can say no more today. You can come tomorrow and tomorrow—until your money is exhausted."

#### Hydraulic "nerves" and "muscles" for superhuman tasks

How is a huge, 16-inch gun turret on a battlewagon swung into firing position?...

How is a big 90-mm. antiaircraft gun kept trained on its fast-moving target?

These and other tasks of warfare are too tough for the controlled muscle power of mere man. So they are performed by made-to-order "nerves" and "muscles" of steel and oil, using the principle of hydraulics.

Hydraulic "nerves" and "muscles" can move and control many hundreds of tons at the touch of a finger on a lever. And with hairbreadth precision.

Even before the war, Vickers Inc., a division of the Sperry Corporation, had years of experience in applying hydraulic power and control to industrial devices, and to Army and Navy weapons

Wartime brought additional assignments. Here are a few examples . . .

They turn the belly turnet of a liberator—against terrific wind pressure. That takes plenty of muscles—so the "muscles" and controls are hydraulic—for speed, precision, smoothness.

They spin the 1550-ton furret on a battleship. This means training and elevating the monster 16-inch guns mounted three abreast in a heavy, armored turret. Precision, speed, and dependability are vital. The hydraulic drive is one reason for our Navy's deadly gunfire.

They keep ack-ack guns on the turget. In response to firing data from the Sperry Antiaircraft Director, our Army's 90-mm. antiaircraft guns are automatically positioned on the target. The hydraulic control mechanism responds to a movement of a thousandth of an inch of the controls.

They open the mouth of an LSM. When it's time for the bow doors of a Landing Ship Medium to open, it's time for action, Positive, dependable operation may be a matter of life or death. This heavy job is entrusted to Vickers hydraulics.

While the applications of hydraulics to modern weapons are spectacular, Vickers equipment is performing equally important tasks on the production front,

Giant presses, intricate machines for making munitions, machine tools, and oil-well machinery are but a few examples.

When Victory permits, Vickers precision hydraulic equipment will help produce hundreds of postwar products,

Casite Guarantees Summer Starting in Winter Weather or Double Your Money Back.

Old Man Winter is roaring 'round the corner again. And back with him come winter starting worries. Your engine coughs and sputters . . . refuses to start . . . runs down the battery . . . causes needless delay and expense.

Casite is the guaranteed answer to

winter starting troubles. Casite cleans out motors and keeps them clean—speeds oil flow, gives quicker compression. Result: your engine leaps to life, even in the coldest weather.

Casite is sold by service stations, car dealers and garages everywhere, for only 65¢ a pint.

THE CASITE CORPORATION - HASTINGS, MICH.

FUATABLE We guarantee that any motor capable of being started in a warm room will start in the coldest weather when Casate is added to the cranicase... Add Casite according to Instructions. If your car fails to start, you get double your money back by filling out guarantee cartificate and mailing it to The Casite Corporation, Hastings, Michigan. Mailinian reland in \$1.30 per plut, which is twice the nationally advertised price of Casite.

#### How to make linoleum stay down

IT'S EASY to make an excellent linoleum cement with Casco Glue, Simply mix 1% measures of Casco with 1 measure of water,

Apply this mixture liberally to the clean floor with a heavy brush. Roll linoleum carefully over this space and place sandbags or weights on top surface to assure even pressure. Keep weights on for 12 hours or overnight.

#### Casco Glue wins on 4 counts

Unusual strength. Caseo Glue hardens and sets chemically to form a bond of remarkable strength and toughness.

Greater durability. This glue is highly resistant to dampness, heat, and age.

Easy to mix. Caseo Glue mixes easily with cold water—no heating problems.

Economical. A little Casco goes a long way. Mix it as you need it. The powder, if tightly covered, lasts indefinitely.

For special outdoor jobs and water projects, ask for Cascamite—the waterproof plastic adheave.

You can get both Cases Glue and Caseamite in 10¢, 25¢, and larger sizes at all hardware stores.

Send for free Casco Project Bookiets and free Gluing Guide containing 50 household gluing hints. Just address a post card to Casein Company of America, Dept. 52, 350 Madison Avenue, New York 17, N. Y.

#### Miracles in Bonding

(Continued from page 78)

general public in small packages shortly. Phenolic, melamine, and urea resins are classed as thermo-setting materials. The term has a very special meaning in the adhesive and plastics industries. These resins, when heated, first melt and then solidify while still hot. They cannot be liquefied again by heat. There is another class of synthetic adhesives called thermoplastics, which act differently and are therefore employed for different purposes. These are applied by heating and set only when cooled. The same amount of heat will liquefy them again. These are used in a great many applications such as the bonding of fabric to produce waterproof raincoats, ponchos, and tarpaulins. They have the advantage of remaining flexible after setting and also the important property of high resistance to gasoline, oil, and other substances that rubber cannot withstand.

As might be expected from all this, the new adhesives have also entered the packaging field with sensational results. Wartime needs for waterproof packaging of food and many other supplies have brought suddenly into being some entirely new and higher standards. The armed forces have naturally demanded packages that would stand the utmost in weather, and they have got them from the packaging industry by the rapid development of resin-based adhesives of many different, formulations. They even got packages that could be thrown overboard and floated ashore without coming apart, and that are oilproof, verminproof, gasproof, and moldproof.

Will older forms of glue go out of use as a result of this rapid development of new and better adhesives? Nobody predicts that as yet. In general, the synthetic resins are costlier than ordinary glues. In wartime we pay little attention to costs, but the stiff competition of civilian business is a different matter. The great strength and durability of the new glues insure their use to the exclusion of others in many applications. In other cases the older starch, casein, and animal glues will be good enough. It is difficult to make accurate predictions at this stage, but at any rate we now have glues . for all purposes which are so far superior to those we have known heretofore that we need to revise our ideas entirely as to what an adhesive really is and what it can do.

The director of one of the big research laboratories puts it this way: "Before the war, glue was merely stickum; now it is an engineering product."

#### How to use **Grinding Wheels**

THE secret of using a grinding wheel successfully is to select one that is of the right grit and grade for the work to be done, and then to operate it at the proper speed. Although, where maximum efficiency is required, such as in production work, it may be desirable to use a wheel designed for the particular job, it is not necessary to have a large assortment of wheels for all-purpose granding such as that encountered in the average home workshop, garage, repair shop and on the farm.

Wheels made from Carborundum Brand Silicon Carbide are adapted particularly to the grinding of brass, aluminum, cast iron, bronze and other metals of low tensile strength. Wheels made of Aloxite Brand Aluminum Oxide are used for granding all kinds of tools, steels, metals and materials of high tensile strength. Sold by hardware dealers every-

To get full information on the use of grinding wheels in your workshop, write for your free copy of "Short Cuts to Better Work for the Home Craftsman." The Carborundum Company, Niagera Falls, N. Y.

(Continued from page 98)

of that number. An enemy fighter trying to get at the pilot and copilot flies directly into the fire of eight guns. All of these guns are remote-controlled. All of them compensate automatically for range, deflection due to the speed of the firing platform, the speed and course of the target. the effect of gravity, and other variables,

At the start, some of the experienced gunners didn't like the remote-control device. They could do better with an ordinary power turret, calculating their "lead" in their heads, they said. So to show them, we held a contest. We put green gunners at the remote controls and pitted them against the old-timers. For the men at the remotecontrol guns it was like shooting fish in a barrel. That settled the argument

The record of enemy aircraft shot down on raids is eloquent of the plane's firepower. In two raids in which the fighter opposition was described as weak to rather light, the gunners accounted for a total of 21 planes plus 22 probables and 23 damaged

B-29 crews were somewhat baffled when the Japs broadcast that the "super air fortresses, being larger than ordinary bombers, were easier targets for our fighters." It didn't make sense. Nor did it make sense when Tokyo in the next breath announced that key cities in the Japanese homeland

The plane's speed is protection in itself

would be evacuated in part.

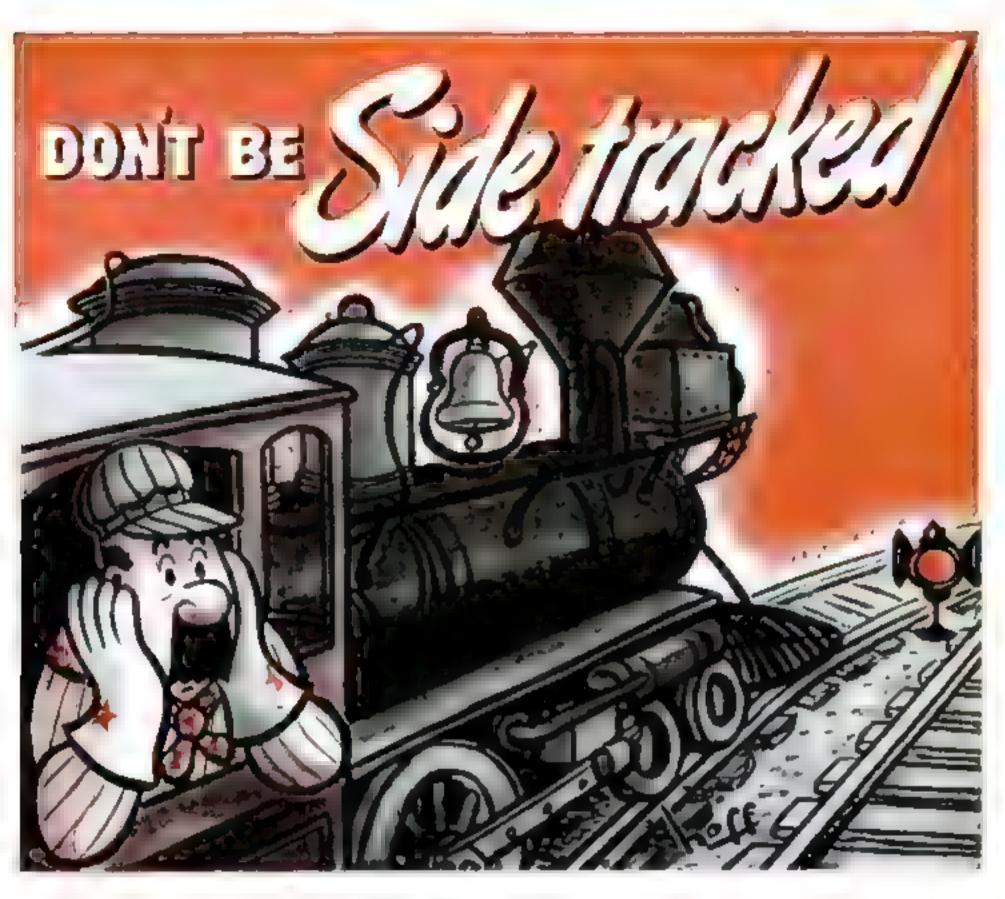

In one flight over the Hump from China to India, a B-29 was jumped by a half dozen Tojos near Myitkina, Burma, at an altitude of 22,000 feet. The Tojo is a fast, radialengine fighter that looks somewhat like a P-47. This particular Superfortress had never been on a combat mission. Its crew was green. The Japa stacked up high to take their turns.

The first one to make a pass did get in some shots, but in trying to establish a normal assault curve that would bring him out in a safe dive he misjudged his target's speed. He had to cock his plane over almost on its back to bring his guns to bear, and as he peeled off his belly offered a perfect target to the bomber's rear gunner. The Jap went down smoking

The other five Tojos dived, but all they hit was thin air where the B-29 had been.

The altitude at which the B-29's fly is additional protection. Our crews have seen the best of the Jap fighters struggling to get abreast of them after half of a Superfortress task force had bombed the target

#### WHAT KIND OF A "LIGHT" DO YOU WANT IN YOUR HOME AFTER THE WAR? SEE THIS NEW LIGHT AT YOUR DEALER'S

VERD-A-RAY is a new type of incondescent light bulb scientifically designed to make seeing easier. In comparison with the "pinkish" white light of ordinary frosted lamps, note the comforting "postal greenish" white light emitted

by VERD-A-RAY.

Scientific research data indicates improved visual (sharpness) acuity, relief from eyestrain and reduced glare.

Many war plants use VERD-A-RAY, one such plant reporting in a trade paper that hospital treated head-aches were reduced 69.13%, hospital treated minor accidents were reduced 54%, and 357 productive manhours were saved in one department in one month after proper installation of this new "glareless" lamp.

#### New Era in Bombing

(Continued from page 222)

and turned about to go home. Most fighters begin getting aloppy on the controls at 30,000 feet. The air is thin; allerons, elevator, and rudder respond sluggishly to the stick. In contrast, the B-29 is almost as well-behaved at high altitude as it is at sea level.

Jap flak gunners misjudge both the speed and altitude of the B-29. The Intelligence interrogation forms made out after a raid often record that the AA was "low and trailing."

The new techniques that I have mentioned cover a multitude of things that, for security reasons, cannot be described. But I can say that a rapid-fire camera, connected with the bomb-sight mechanism, gives A-2 a running pictorial account of a raid when the planes have returned to base. It starts shuttering a given number of seconds—depending on altitude — after the shackles release the bombs, and it keeps recording the results until the plane banks for the return home.

These new techniques include a division of labor inside the airplane made necessary by its bulk and complexity and its occasional assignment as a lone-wolf bomber. The copilot is a competent meteorologist. The bombardier is a navigator, the navigator a bombardier. The radio man is a radio mechanic. The flight engineer is an engine and airplane expert. Two of the gunners are good mechanics. One of the gunners is a highly trained first-aid man.

In case of a forced landing the crew can make even major repairs, including engine dismounts and overhaul. In its capacious belly a B-29 can tote a couple of spare engines on a relief mission to another field It is no secret that B-29's have been flying their own fuel over the Hump, and to see a ship disgorge 10 tons of gasoline is no novelty.

To judge fully of the effectiveness of the plane as a bomber, it is necessary to assess as well the by-products of its extreme range. On the first Anchan mission, directed at the great Manchurian coke ovens, a first-degree slert was sounded along all of coastal occupied China from Shanghai north, and around the Yellow Sea through the Korean peninsula, not to mention throughout Japan proper.

The Japs didn't know where we were going. The force flung at them was large, and, for all they knew, portions of it could be splintered off to strike simultaneously at targets in an area of thousands of square

(Continued on page 232)

#### MORE PLANE FOR YOUR MONEY

BY "MORE PLANE" we don't necessarily mean a bigger or heavier plane for less money. We mean finet performance, greater stability and longer cruising range—more genuine owner satisfaction.

But don't take our word for it! Ask any Taylorcraft owner at your local sirfield—he'll tell you how it can outfly and outclimb any plane in its class.

And he'll give you scores of other reasons that will substantiate our statement-Taylorcraft-

more for your money.

The new Taylorcrafts will be well worthy of the reputation established by earlier models. Valuable experience gained through the building and designing of Army and Navy light planes in large volume, and the availability of newly developed materials will contribute greatly to the performance of your postwar Taylorcraft.

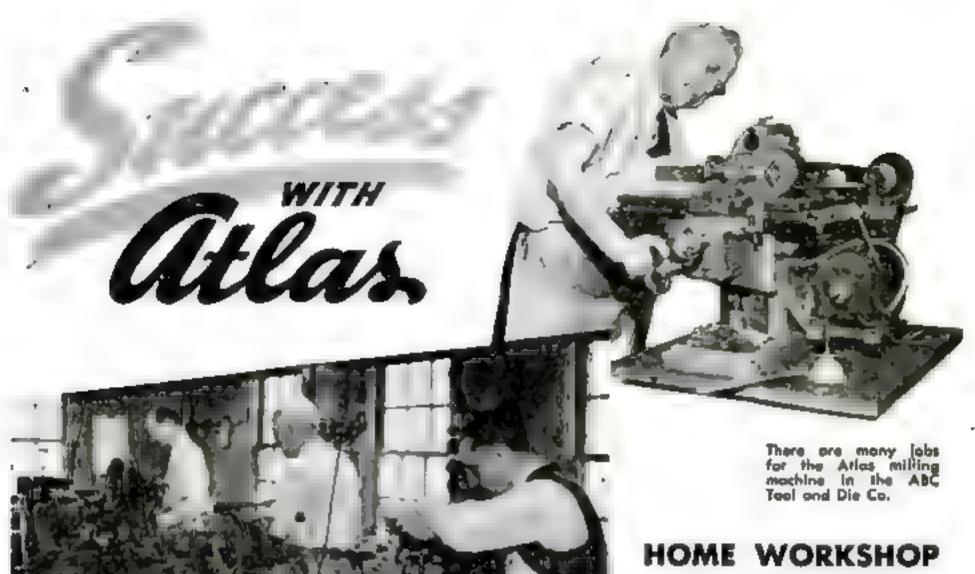

Our sum is to deliver to a peacetime America, in the future as in the past—more flying for your money.

World's Largest Buildors of Side-by-Side Airplance

TAYLORCRAFT AVIATION CORPORATION - ALLIANCE, OHIO

## HOME WORKSHOP BASIS OF SMALL BUT VITAL WAR PLANT

One day's work a day wasn't enough for Mac Milligan and Jack Ryan, Rochester, N. Y., when the Axis took on Uncle

Sam. So the two veteran machinists pooled their home shop resources . . . an Atlas lathe, milling machine, shaper, and drill press . . . and began making tools and dies in their spare time.

Soon Mac and Jack had to spend fulltime on their business which they named the ABC Tool and Die Company — and one by one retired machinist friends offered to pitch in and help. More machines were purchased . . . including four more Atlas lathes . . . and the plant force grew to sixteen men with thousands of vital precision products to their credit.

What these two patriotic Americans did is typical of the efforts of many hundreds. In small shops and home workshops, Atlas tools pointed the way to profitable after-hours work that grew into a thriving business. Be sure to find out about low-cost, compact Atlas tools for your postwar shop!

NEW PATTERN SERVICE for WOOD CRAFTS-MER too Atlas at page 201

#### Now—Air Operated Collet Chuck Relieves Second Operation Work on Screw Machines

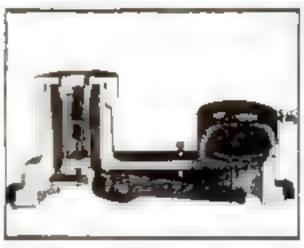

Work formerly requiring automatic or hand acrew machines can now be done at much less cost through the combination of this new air chuck and any drill press. The Redmer Air Chuck is a collet air chuck using standard Brown & Sharpe type screw machine collets. The collet remains stationary, the opening and closing controlled by a sleeve action.

By using a collet as the chucking means, slight variations in the diameter of the work as frequently experienced with automatic and hand acrew machine products can be permitted without sacrificing accoracy of concentracity. Thus accomplishing an important saving in time and cost.

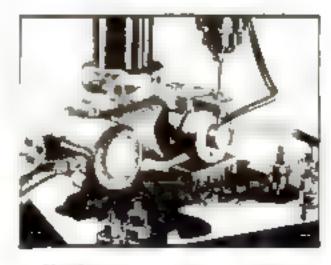

The sir chuck is an ideal tool for holding parts for drilling, milling, slotting, burring, chamfering, boring, counterboring, tapping, threading, reaming and other work where the machine operation should be concentric with the chucking surface. It is adaptable to many different jobs merely by changing collet and stop. This results in saving of valuable production metals and materials. The chuck will take any type work whether round, hex, square or rectangular, and permits full efficiency of the operator, as it is operated by a foot operated valve thus leaving hands free to load and unload—reducing faugue and cutting unproductive time to a minimum.

Wrigley's Spearmint Gum, too, is a help on the job. For chewing gum helps relieve dry throat, and helps ease fatigue brought on by the strain of work. And at the same time you are chewing and getting the benefits of swell tasting Wrigley's Spearmint, both hands are free and you need not take a "time out." The Army and Navy have recognized these benefits and are now shipping overseas ent, all of the limited production of Wrigley's Spearmint, When Wrigley's Spearmint can again be produced in sufficient quantity for all, the valuable benefits of Wrigley's Spearmint Gum now being proven on the battlefield will apply to industry here at home.

You can get complete information from Redmer Air Devices Corp., 601 West Washington Blud., Chicago 6, 111.

An air operated collet holding fixture for precision chucking or mechine tools

#### New Era in Bombing

(Continued from page 226)

miles. First-degree alerts cut down the enemy's industrial output.

As an aircraft the B-29 is a versatile machine. On one raid the pilot of a Superfortress, unhappy about his position in relation to the target on his first run, and again on his second, made a third try.

"I pulled her around with no trouble at all," he said. "She handled like a fighter."

In a raid on Nagasaki we cascaded incendiaries on the Kyushu Island naval installations. While it would not be good Intelligence to let the enemy know what we know about the effectiveness of our raids, it can be disclosed that a brace of B-29's enjoyed the results of that visit so much that they stooged around too long watching the show. That left them short of fuel and they had to make intermediate landings on grass-surfaced fields with runways less than half the length of those at their home base.

The incident stilled once and for all the allegation that the B-29 had to have a runway as big as all outdoors to get off the ground. Those rock-and-slurry (mud) runways that we use were built long partly to reassure the crews of our heavily-laden bombers and partly to reduce the chance of operational losses.

In the beginning the crews were worried about the pressurized interiors. They thought that if the fuselage got a hole in it anything might happen. (See page 136.) I have seen a B-29 come home after several hours at high altitude with a nine-inch hole in the skin and still with sufficient pressurization to obviate the need for oxygen masks. The superchargers have plenty of excess capacity.

Emergency rubber patches are provided for bullet holes, but one crew, receipting for .50 calibers from a Jap fighter that stood off at a respectful distance, prankishly patched the ship with cheese from their sandwiches to see if it would work. It did.

So far as we know, the Japs don't have a very clear idea as yet of the kind of weapon being used on them. In one broadcast they described it as a "large-type bomber of 42 tons, of an extensive cruising radius and equipped with four-motored engines." That's a rough idea—quite rough.

Radio Tokyo has called the B-29 "fragile."
The ship has been landed wheels-up in a dry river bed and been back in action within a week. One Jap commentator said the plane was made of shoddy, creatx materials.

(Continued on page 240)

#### Caught in the Widow's Web...

Boring into the inky blackness, the P-61 Northrop Black Widow ferrets out the enemy with an electronic eye and delivers a torrent of connon and machine gun fire.

As hefty as a light bomber, but with the agility of a single seat fighter—that's the "Black Widow." Like most other outstanding U. S. fighters\*, the P-61 uses Curtiss Electric Propellers.

#### LOOK TO STEVENS FOR THE GUN YOU'LL WANT

Are you thinking about a new gun for postwar hunting, target shooting or just plain and fancy "plinkin'?" Then look to Stevens for the best buy in a rifle or shotgun.

Right after war restrictions are lifted, you'll be able to pick from a wide variety of Stevens-built models. They'll have all the fine features you'll be looking for—at surprisingly moderate prices. You'll find them outstanding in value—the result of Stevens' long experience, sharpened by Victory production of military arms in great quantities.

Thousands of shapters own Stevens Springfield Brand single and double barrel shatguns and .22 rifles. These extremely popular models will again be available. And so will the newer Stevens models like those illustrated below.

First Prize . . . \$500 in War Bonds Second Prize . . \$200 in War Bonds Third Prize . . . \$100 in War Bonds

and eight prizes of a \$25 War Bond each.

Send your entry to Contest Editor at MIDWEST RADIO CORP., Dept. 59 J, Cincinnati 2, O.

#### WANTED:

## Engineers with talent in tooling, machine design, precision assembly methods...

The United States Time Corporation—the world's largest watchmakers—are making precision instruments for war.

For this big job, we need engineers. Engineers with talent in tooling, machine design, precision assembly methods. Engineers who appreciate teamwork and will share our zeal for accomplishment. Engineers

who want permanent jobs.

We suggest you fill out and mail us the attached coupon.

#### WHERE PERFORMANCE REALLY COUNTS...

#### ... COUNT ON DEPENDABLE

#### CHAMPION SPARK PLUGS

Add to our own vastly increased requirements for food, those of untold millions who desperately need it, but cannot now produce it, and the burden on the American farmer is staggering. Yet with the characteristic vigor of the home-front soldier that he is, and the aid of power farming equipment which multiplies his ability to produce many fold, he is meeting the need with magnificent fortitude. His car, truck, tractor, stationary engines, and the implements used in conjunction with this power equipment are literally the farmer's "strong right arm." Dependable Champion Spark Plugs, long-time favorites of farmers everywhere, play their vital part in keeping engines smooth, economical and dependable. Realizing their importance, most farmers inspect, test, and clean all spark plugs at regular intervals — install new Champions when necessary.

Finish The Fight With War Sonds Buy More Then Before HOW!

#### New Era in Bombing

(Continued from page 232)

If anything, it is constructed of platinum and diamonds.

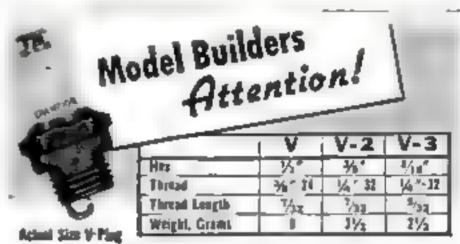

The Twentieth has had its problems. Engines have been troublesome, for one thing That isn't their fault. We've carried as much as a 40,000-pound overload on those four Cyclones. Our distances are great and sometimes we have to. Cylinder heads burn out and must be replaced.

We are not getting away with our raids scot-free. The communiques tell of airplanes failing to return. Occasionally flak gets them. Sometimes Jap fighters making head-on attacks don't peel off fast enough, and collide. Once in a while operational losses plague us, as they plague any bomber command. But those losses are far from being prohibitive.

The men of the Twentieth believe in their airplanes, and in a long-range program of strategic bombing that is almost everything. Their welfare, their comfort, is a paramount consideration of the Command. When they clamber into their planes they are handed compartmented food containers from which dangle electric cords. There are six compartments in each, containing six meals, from soup to chewing gum. For a hot meal, all a man has to do is plug a container into the B-29's electrical system.

And on the way home from a raid the crew passes the hours enjoying Tin Pan Alley tunes, brought in by the radioman and piped throughout the ship. True, it's canned. It has been recorded—by the Japs—from broadcasts of American orchestras for a "psychological offensive" against American soldiery in Asia.

The Superfortress crews are grateful to Radio Tokyo for entertaining them while they wear down Japan's will to make war.

Champion spark plugs for model gas engines give the same dependable performance as regular Champions. Siliment sealed, Silimenite insulator. Alloy needlepoint electrodes for easy starting. One piece construction.

#### CHAMPION

SPARK PLUG COMPANY . TOLEDO 1, OHIO

Think of fluid power as the three-link chain: Source—Circuit—Utilization.

The Circuit is the key link. It may go around corners and into tight places. It may even be vulnerable. Too often it is just taken for granted.

The success of fluid power depends on the engineering of the Circuit. That is Parker's business.

We do the engineering from design through to installation. We build the valves and fittings and the tools to handle them.

Our specialized know-how distilled from twenty years' experience with Fluid Power System is at your command.

The best way to get this know-how applied to your problem is to ask a Parker engineer. Or write direct to The Parker Appliance Company, 17325 Euclid Ave., Cleveland 12, Ohio.

#### PARKER SELECTED TO DISTRIBUTE SURPLUS WAR STOCKS OF PRECISION VALVES AND FITTINGS

Recognizing that users of precision valves and fittings would be served best by having war surpluses made available through an organization with broad application experience, Metals Reserve Company has appointed Parker to be a distributing agent. For details on type, quantity, specifications and application of this very large stock, write, wire or telephone

Crown of

#### steel for a queen

As significant in its way as the coronation of an earthly monarch, is the placing of the steel superstructure that crowns a queen of the sea. And surely a fine ship is queenlike, for she possesses regal beauty, proudly defies the wind, the weather and the sea and gives royal guardianship to the men who sail her. These qualities are imparted to a vessel by the shipbuilders—men who build with their hearts as well as their arms. Theirs is both an art and an industry—a craft and a science. For nearly forty years, Defoe has been building and crowning queens of the sea. Yesterday, beautiful yachts and hardy small craft came from the Defoe ways. Today, fighting ships for the Navy. Tomorrow, for peacetime America, Defoe will build private vessels and industrial products that reflect the skill and devotion typical of the shipbuilder's art. This is the only way we know how to build.

# Two miles up-with an ear to the ground

Keeping posted high in the air is one secret of successful flying. The ground keeps track of the plane. The plane knows the weather, the course, and what it's like at the field.

Lear was among the very first to make aircraft radios — had gained an enviable reputation for fine radio and navigation instruments long before the war — was ready when war needs demanded greater and greater technical development.

Some of these developments can't even be mentioned now. They're too secret. Some are in the field of electric aircraft con-

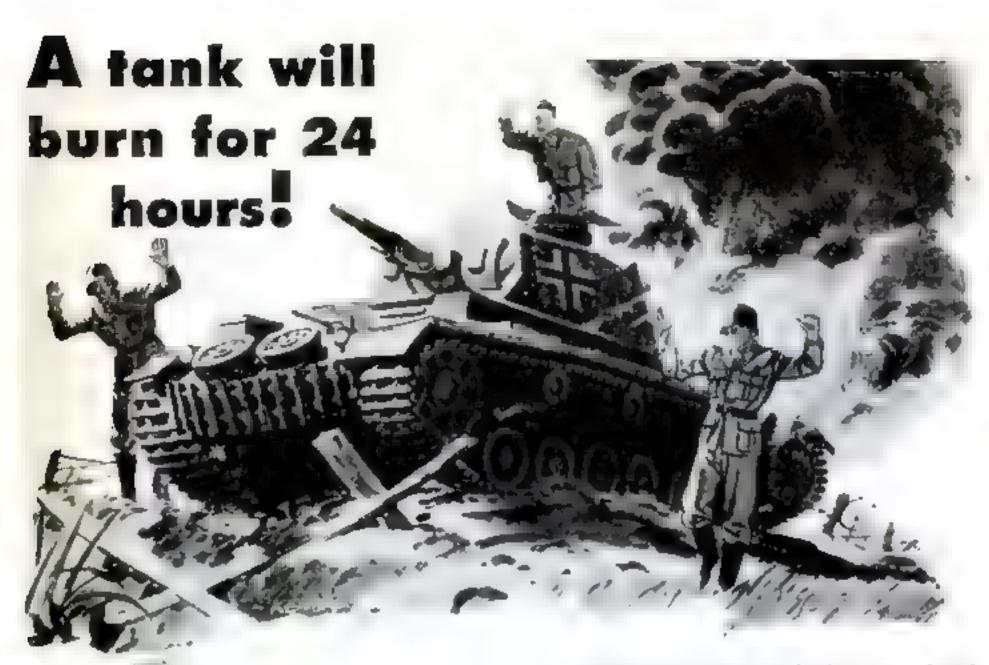

trols. Some will have no use outside of war.

But there are others that hold vast promise for everyone when peace returns.

With its war job done, Lear will turn its discoveries, its developments, the resources of its laboratories and plants toward adding new comforts, new conveniences, new pleasures to the lives of America's families.

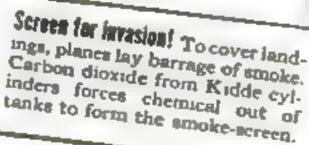

PLANTS, Pique, O., and Grand Bapids, Mich. SEANCHES AT: How York, Los Angeles, Chicogo, Dutroit, Cloreland

Volatile fuels used in high-powered tank engines make fire a constant threat to tanks! But on our armored giants, first lick of flame sets off a warning signal, the driver reaches for lever and blaze is smothered instantly under a blanket of carbon dioxide snow-gas. Kidde designed this system especially for tanks.

Gases-under-pressure, harnessed by Walter Kidde & Company, are serving our fighting men in many ingenious ways. After the war they'll serve you, Look for them!

WALTER KIDDE & COMPANY, INC., 140 CEDAR ST., NEW YORK 6, N. Y.

BY CONTRAST they seem worlds apart . . . the spectacular Evinrude "quads" that drive these swift assault craft . . . and the peaceful "fishing" Evinrudes that every sportsman knows. But the big motors in olive drab owe much of their great performance to the peacetime Evinrudes that came before . . . to more than 30 years of concentration on building pleasure motors better and better . . . lighter and more powerful . . . ruggedly reliable and trustworthy. In stepped-up measure these qualities are built into the Evinrudes that serve on battle fronts today. After Victory they will again be yours . . . in new Evinrudes designed for your greater enjoyment of every hour you spend on the water! Evinrude Motors, Milwaukee 9, Wisconsin.

#### EVINRUDE OUTBOARD MOTORS

Today, you cannot buy this new "Pocket" Stove. Originally designed by Coleman, it is exclusively built for the use of the armed forces.

When peace comes, this compact, amazing, little magic stove will double the joy and convenience of millions of picnickers and sportsmen. Easy to carry as a thermos bottle or flashlight. Only 8% inches high, 4% inches in diameter—yet the "bottest" little cooker

you ever touched a match to. Telescoping case makes two handy utensils. Ready in minutes for cooking, heating drinks, purifying water, It's the outdoor stove of tomorrow. Every hunter, fisherman, camper will want it. Grand for backyard picnics, too—and for hundreds of uses around the home.

FREE BOOK - Write for dramatic picture story of the Coleman "Pocket" Stove at the fighting fronts.

# SENSATIONAL WAR BARGAINS IN LENSES & PRISMS

OUR ITEMS MAKE EXCELLENT CHRISTMAS GIFTS—
All Neatly Packed and Marked

Our Policy on War Surpluses -We are cooperating to move surplus while the war is still on. Our customers receive full benefit of all savings effected through our purchases of war surpluses. We do not hold merchandise for high future prices.

#### SPECIALS IN LENS SETS

... the unique Xmus Oits, popular with Servicement Big 10 Page Project and Idea Booklet with all sets—describes successful developments—points the way to new experiments.

Set No. 301-N "Our Advertising Special" 15 Lenses for \$1.60 Postpaid. For making your own powerful telescopes, low power microscope, strong magniflers, drawing projector, photo cells, telephoto lens, dummy focusing camera, Kodachrome viewer stereoscopic viewer, ground glass and enlarging focusing aids. For experimental optics, portraits of babies and small pets copying, ultra close-up shots, and many, many other uses

Set. No. 305-N "The Gudgereer's Pelight" 35 tenses for \$5.00 Pestpoid. Contains all the lenses in the above set plus twenty more expensive lenses increasing your field of experiment and gadget making. All our lenses are neatly packed and marked.

Set No. 310-N "The Experimenter's Dream" 60 Lenses and New Complete 50 Page Seaklet—\$10.00 Postpoid. Contains all the lenses in the above sets plus 25 others that makes this a sensational buy The variety of lenses in this set will enable you to conduct countless experiments and build a wide variety of optical equipment.

New 50-Page illustrated idea Book . . . \$1.00 Postpoid. "Fun with Chipped Edge Lenses" describes a wide variety of uses for our lenses and contains much information especially designed for beginners in optics.

# TANK PRISMS

In order that the tank driver shall not get shot in the face, two of these Silvered Prisms are used to make a periscope (without magnification).

We have secured a number of these that are very slightly chipped, making possible their sale at a very low price. They are 90-45-45 degree prisms of huge size—5% long, 21/s" wide, finely ground and polished. Other uses for these Prisms: Experimental Optics, Optical Instruments and Godgets, as unique gift item, unusual paper weight, dask name plate, etc. Normally these Prisms would retail from about \$24 to \$30 each.

Stock No. 3004-N . . . SILVERED TANK PRISM—Price \$2.00 each Postpold.

Stock No. 8006-N . . . PLAIN TANK PRISM— Price \$2.00 each Postpaid. This one is excellent for projecting all the colors of the spectrum—a beautiful sight

FOUR TANK PRISMS—Special \$7.00 Postpold . . . . This is the most sensational bargain we have ever been able to offer.

#### PROJECTING LENSES

16 MM. Achremetic Projecting Lenses. Set No. 4002-N. . . consists of 2 comented achremets, 18.5 MM, diameter with effective focal length of 2". Originally mfg for U. S. Government . . . 54.00 Postpoid.

35mm Slide Projecting Lans Set—No. 4004-N ... \$1.50 Postpoid. (May also be used for enlarging 35mm to 24 x 24. Film.) Consists of 2 uncemented achromats 144 inches in diam. Mounting directions and cement supplied Free.

#### MAKE YOUR OWN RIFLESCOPE

Complete set 5 matched Achromatic Lenses, originally produced for U S. Navy gunscopes—8½ Power. Order No. 2000-N . . . \$11.00 Postpoid.

## FOR TELESCOPES

These will delight all telescope makers. Originally manufactured for use in U.S. Govt. Binoculars. You can use in telescopes, binoculars microscopes, etc. Consist of achromatic eye-lens and a field lens. Focal length 27.5 mms.

Stock No. 6060-N--Uncemented and Unedged

\$.75 Postpaid

Stock No. 6061 N Uncemented but Edged

M.G.M PRESENTS KING VIDOR'S PRODUCTION IN TECHNICOLOR

BEEN A

BIG CHANGE

\* For years old "999" was undisputed champion of locomotive design and performance.

But she couldn't keep up with progress.

For years nobody challenged the efficiency of the conventional tapered roller bearing, either—until transportation and industry heaped increasing burdens on bearing service.

It's the rollers that carry the load. And Tyson

found the way to add more load-carrying rollers around the raceway. Result: a sturdier, longer-lasting heavy-duty bearing.

The Tyson "All-Rolls" design is leading the progress parade by doing many tough jobs better—and lasting longer—than bearings with fewer rollers. The big name in bearings today is . . . TYSON!

# It's miraculous how these HARLEY-DAVIDSONS standup"

One of the finest tributes Harley-Davidson Motorcycles ever received is in this letter from T/Cpl. E. J. E., in the Pacific area:

"It's miraculous how Harley-Davidsons stand up under combat conditions. We have a stretch of road 35 miles inland and there isn't a road in the states that could be half as bad. Dust about 6 inches deep, and hills so steep that locked wheels won't hold when we stop. That's where power is needed and a good sturdy machine. I even forded streams where the water was swirling around the air cleaner — and she kept running. It's a new deluxe Harley-Davidson for me after the war. It's a great motorcycle!"

No more need be said after that except — Buy War Bonds NOW for your own Harley-Davidson after Victory!

### In the Ford kitchen . . . this little trial engine sputtered into life

IT HAPPENED far back—in the very early 1890's. In the kitchen of his Detroit home, a young engineer, named Henry Ford, was testing a principle of the internal combustion engine.

His apparatus, clamped to the kitchen sink, was a piece of one-inch gas pipe, reamed out for a cylinder—the flywheel, a hand-wheel from a lathe. Gasoline was fed from an oil cup. A wire connected to the kitchen light furnished the spark.

He spun the flywheel. Flame came from the exhaust, the sink shook and the trial engine was running under its own power. Mr.

Ford was satisfied. He put the engine aside. It had served its purpose. His idea was proved.

But he did not stop to applaud himself. "The man who thinks he has done something," Mr. Ford once said, "hasn't even started." His mind was already stirring with thoughts of a new and larger engine for transportation use.

Just ahead lay the pioneering which was to produce the Ford automobile of world-wide use. Ahead lay the creation of the first industrial assembly line, hundreds of inventions and improvements, the building of 30,000,000 low-cost motor cars and trucks to

serve the needs of all the people.

Today, at Ford Motor Company the pioneering still goes forward. New methods, new materials, new devices are continually being developed. You don't hear about many of them, because Ford assignments now are military.

But one day the story of this modern pioneering can be told. It will be told, you may be sure, through the medium of Ford, Mercury and Lincoln cars so advanced in both style and engineering that new millions will seek to own them—for comfort, for smartness, for reliability, and for economy.

AND THIS IS THE BOOK THAT WILL HELP YOU

HANDBOOK FOR

Model Builders

PUBLISHED BY LIONEL

When Lionel Trains Are Made Again, You'll Be Ready for Them

24 EXCITING CHAPTERS, 192 PAGES IN ALL

How to Begin. Monning the Layout, Looking Ahead, Layout Suggestions, Grant Railroads, Layout Blueprints, Tables and Benches, Cuts and Fills. Grades and Elevations, Lakes and Waterways, Bridges, Tresties. Trackwork, Signals, Scenery, Stations, Yards, Engine Terminals, Real Estate Improvements, Landscapes, Motive Power, Ralling Stack,

Pictures, plans, blueprints, facts, figures and instructions that tell the complete story of model railroading from the ground up—show you what to do to build a train set into an extensive operating system—how to plan a layout that will look like a real railroad—how to build an elevated division, a miniature lake, river or waterfall—how to ballast the roadbed—how to operate trains accord-

ing to real railroad practices and make them duplicate everything that real trains do. BEST OF ALL, the Handbook shows you what you can do NOW so that you will be ready when the war is over and Lionel Trains are again being made. Clip and mail the coupon below, enclosing One Dollar in check or money order. A copy of the Handbook will be sent to you by return mail.

WAITING ...

With 12 million red-blooded men busy in the armed services, lots of fine fish are grow-

ing fat (and careless). The "good spots" are better than they ever were—just waiting to be fished. Beautiful fishing models of Johnson Sea-Horse outboard motors will be waiting too, when the right day comes.

WAITING.

We have been making lots of outboard motors right along. For war. It will take some time,

when materials and manpower are released, to stock up on the deluxe models you want. But we will do our best to see that they are ready when Johnny (and Jane) come marching home.

# Speed Sweep WITH A BACK OF STEEL

Steel back of Speed Sweep brushes is the basis of unique construction for faster, easier, better sweeping. Black is narrower — easier to handle. Tufts of longer, better fibres are more compact — provide "spring and snap" action. Handle instantly adjustable to height of sweeper — reduces fatigue and strain. Speed Sweep brushes are built to autlast ordinary brushes 3 to 1.

FULLY GUARANTEED. Since Poor! Harbor Speed Sweep brushes have proved their superiority in many thousands of factories under varied conditions. They are unconditionally guaranteed to meet your requirements. Prompt shipment on AA 5 or higher priority rating. Write for styles, uses, and prices today.

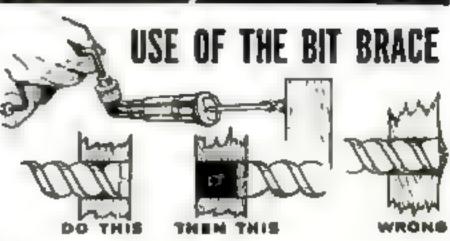

Mere's a genuine Hide Glue that needs no mixing, no heating. Comes ready-to-use. Eliminates chilled joints. Tests prove Franklin stronger than the wood itself.

AT YOUR HARDWARE DEALER Or Send 30 Cents for 1/4 Pent to The Franklin Give Co., Columbus 3. Ohio

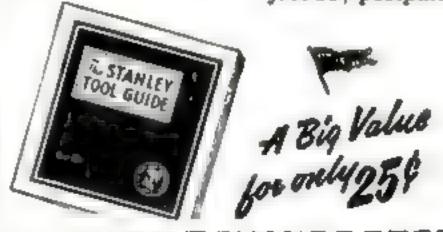

To produce a clean hole with brace and bit, bore into the wood until screw point on bit barely emerges on the second face. Remove bit from hole and, centering bit in small hole left by screw point, finish hole from second face. This method avoids splintering wood and assures a neat job.

# LEARN DOZENS OF EXTRA TOOL OPERATIONS WITH THE STANLEY TOOL GUIDE

With few exceptions, all tools are capable of many different operations. This authoritative guide book gives practical instructions on dozens of tool methods used by master carpenters and cabinet makers. More than 200 illustrations show operations in detail. Send for your copy today—just 25¢ postpaid.

The prayers of the most worthy people often fall. Why? The unworthy often have the greatest health, success, riches and happiness. The best, smartest, and most industrious people often have only pain, poverty and sorrow. Why? Thirty years ago, in Forbidden Tibet, behind the highest mountains in the world, a young Englishman found the answers to these questions. His eyes were opened by the strangest mystic he met during his twenty-one years of travels in the Far East. Sick then, he regained health. Poor then, he acquired wealth and world-wide professional honors. He wants to tell the whole world what he learned, and offers to send a 9,000-word treatise, FREE, to everyone who asks promptly. It is a first step to the POWER that KNOWLEDGE gives. There is no obligation. Write for YOUR FREE COPY today.

# POOR RICHARD wrote a good hand!

Benj. Franklin won fame with his Almanac . . . in later life was twice ambassador to England, once to France. A clear thinker, he took pride in his clear penmanship. In his Autobiography, he said, "I learned to write a good hand."

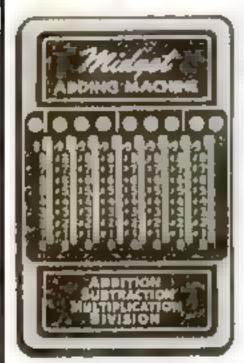

Our present foreign envoys in the AUS-hundreds of thousands of them-may write poorer hands, but have better pens . . . Many treasure an Inkograph ... the precision instrument of penmanship. Sturdy and speedy-acting, with smooth flow of ink, it is built to write millions of words.

The needs of service men come first, so if your dealer is out of stock—keep trying. Sorry, no mail orders—only dealers can supply you.

> Use any pen to sign up for more WAR BONDS!

# An Important Factor In Reaching this Goal Is Daily Vitamin Supplementation

Forward-looking manufacturers know that the healthy worker is the most efficient worker and that good health hinges on good nutrition.

Production records in many plants show that workers participating in a planned vitamin nutrition program produce more goods at less cost, have less work and material spoilage, a better mental attitude and less absenteesin than before the vitamin program was installed.

Some of these records are available for you

to see. We will be glad to explain them to any executive, doctor, or nurse upon request. We shall also be glad to mail you our informative, factual book . . . "VITAMINS—A Vital New Force Geared To Industry" . . . and to show you, without obligation, how our ONE-A-DAY Vitamin Nutrition Program can be successfully and profitably installed in your establishment.

# SPEECH UNDERSTANDING TEST

FOR THE HARD OF HEARING

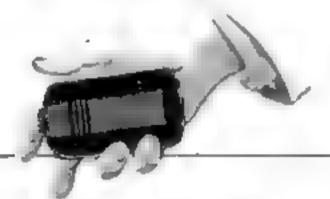

There's a big difference between hearing and understanding? Try this test, with and without your hearing aid. Have sentences read aloud, speaker 12 feet away, lips conceased Check your score:

RIGHT WRONG

VV

	_	
1. Is the sun larger than the earth?		
2. Name the tree on which bananas grow		
3. Explain the purpose of fire drills		
4. Name a state which has no seacoast		
5. Explain why a corked bottle floats		

If you score less than 80%—you need the new super Telex hearing aid to give you complete hearing. Telex gives you noiseless, effortless hearing, under all conditions. Test a new super Telex. It will be fitted scientifically. The complete speech test will prove our claims. No obligation,

## FOR EFFICIENT PRODUCTION

Close limits and a fine finish are essential for efficient production on many important metal working operations. Maximum output at minimum cost can be attained only when the methods and machines are such that close tolerances and the best possible finish can be maintained on piece after piece, indefinitely.

It is on this type of work—exacting toolroom jobs or production operations that call for toolroom accuracy—that the high precision and dependable performance of South Bend Lathes pay real dividends. Their smooth operation through a wide range of spindle speeds produces surprisingly fine finishes. In fact, when South Bend Lathes are installed, subsequent finishing operations can often be eliminated.

Today South Bend Lathes are better in every way. Our entire plant is devoted to lathe production—we manufacture no other products. There has been no lowering of standards because of war-time restrictions or shortages and the use of substitute materials is negligible, limited to non-essential parts such as name plates, paint, etc. Improvements have been accelerated to meet war production needs.

South Bend Engine Lathes and Toolroom Lathes are made in five sizes: 9", 10", 13", 14½", and 16" swing. Precision Turret Lathes are available in two sizes: Series 900 having 9" swing with ½6" collet

capacity, and Series 1000 having 10° swing with 1° collet capacity. Write for Catalog No. 100-C.

POST-WAR
PRIORITY PLAN
To those who cannot qual-

ify for a war-time priority, South Bend Lathe Works offers a practical Post-War Priority Plan. You can place your order now for any South Bend Lathe. No deposit or down payment is required. We ask only that the order be placed in good faith. When civilian production is resumed, orders will be filled in the sequence established by the numbers of the Post-War Priority Certificates. Should conditions necessitate, the order may be cancelled at any time. Write for details of this plan.

#### March 50 min... rest 10!

Hour after hour, mile after mile, that's Johnny Doughboy's marching routine. And when that 10minute rest period comes along, well, that's when Camels come into the picture. For Camels and uniforms have been constant companions from way back-they were in '18, and they are today, the soldier's favorite cigarette.

## The "soldier's pack"

That's Camels! Cool, extra-mildwith a full-flavored appeal that never wears out its welcome. No matter how many you smoke, Camels don't go flat. Camels always taste fresh . . . good! If you're not already a Camel smoker, try them roday. Let your own taste tell you the meaning of the words, "I'd walk a mile for a Camel."

## FIRST IN THE SERVICE

With men in the Army, Navy, Marine Corps, and the Coast Guard, the favorite eigacette is Camel, (Based on actual sales records.)
